As The Editor Sees It

IN the last week's issue of the GUIDE we printed some interesting views concerning the "open vs closed shop" controversy. The views presented were those held by business and laboring men, and related to the practical concrete points involved in the argument.

There is, however, a still larger side to the question, which concerns more than the rights of the laboring man, or the employer, or the public. This side involves the basic principles of American democracy, and it is the vast and lasting importance of these principles, which demand that this question be settled now in a way which conforms to and upholds these principles.

At a recent convention of the National Manufacturers' Association, Professor G. W. Dyer, head of the department of political economy, Vanderbilt University, Nashville, Tenn., presented logical and indisputable arguments for "Open Shop," viewed from the theoretical standpoint.

American democracy, said Mr. Dyer, as conceived by the founders of this government, has a much broader scope than that which comes within the bounds of political theory. It is a theory of social life, educational life, religious life, and industrial life, as well as a theory of political life. But in the early years of our national life we were almost exclusively an agricultural people and had no serious industrial problem. Under such conditions, it is not strange that little attention was given to the interpretation of the American theory of industry activities.

We have been trying to do an impossible thing. We have been trying to fuse European socialism with American democracy. This attempted fusion has been brought about partially by certain well-meaning people made up of social reformers, social workers, sentimental university professors, generally "made in Germany", and progressives. The time has now come when it is of the very greatest importance for us to define for ourselves the meaning of American democracy as applied to industry, and to draw the line between the American theory of industrial life and the socialist theory.

SOCIALISM AND DEMOCRACY WON'T MIX

For the guidance of the individual in the field of freedom, and for the regulation of production, the founders of American democracy depended on two economic laws: The law of supply and demand, and the law of competition. When wages are relatively low in one industrial field, it is an indication that there are relatively too many workers in that field, and that a readjustment should be made. It is equivalent to hanging up a sign on the door that men seeking a livelihood should go to other fields, where the demand for work is greater. In most cases, this adjustment will be made under a system of individual freedom and individual responsibility in a comparatively short while by turning the stream of boys and young men just beginning their life work to other fields, and in this way wages are automaticlly restored to normal in the over-crowded industry. The essence of the theory is that workers acting from self-interest and using ordinary intelligence will adjust themselves to the places where their work is in greatest demand, and by competition with other workers will rise to positions commensurate with their capacity. The regular working of this system tends to bring about the maximum production, the greatest possible efficiency and the largest possible compensation to the workers.

We have injected into our industrial system the theory borrowed directly from socialism that the worker must be taken care of where he happens to be employed, by some sort of compulsion brought to bear on those for whom he works. That is, that his income must be regulated on the basis of his needs, arbitrarily fixed, and that the employer or society at large or both, should be forced to meet his requirements.

AMERICAN DEMOCRACY MEANS INDIVIDUALISM

It was this socialist theory that was back of the Adamson law. It is this theory that is back of the minimum wage

BLUE PRINTS

movement. It is this socilistic theory that is back of the closed shop and the strike, and strange to say, this socialist theory, that industries must be made to pay employes arbitrarily fixed living wages, has been accepted by those high in authority in Washington in both parties, and is used as the basis of settling industrial disputes.

American democracy does not and cannot in the very nature of the case guarantee anybody any sort of income anywhere. To do this is to overthrow our whole system and completely put out of commission every piece of regulating machinery we have. If we adopt the theory that industry must be compelled to pay a living wage, we take the responsibility from the shoulders of the individual to find the place of his greatest efficiency, and hence the place of his greatest income, and say to men in overcrowded industries, "Stay where you are, your income is independent of the law of supply and demand. However overcrowded the industry, your wages will be kept up to standard by compulsion. You can solve the problem of over-production by doing less work." And instead of such industries turning men away who could ordinarily enter, they become more attractive because of the promise of less work at the same pay. Such a system tends to destroy efficiency, cut down production and bring about industrial chaos and a complete overthrow of the American system. It is not meant that the theory of American democracy is the old theory *"laissez faire."* It was well known that evils would arise under the American system, or any other system of freedom that would not adjust themselves. Certain restrictions and certain regulations are necessary, but the restrictions and regulations must be consistent with our fundamental theory, not antagonistic to it. They must seek to perfect the system, not to destroy it.

Closed Shop Inimical to Americanism

The result is that we can't cut anything, and more than this, we are destroying the cloth. American democracy as a system of industrial life is thoroughly logical and consistent, and socialism taken as a whole, bad as I believe it to be, as a system, is logical and consistent. But a combination of American democracy and socialism is no system at all.

In order to put in operation and keep in operation this socialistic principle of fixing wages by compulsion, the strike is the one essential weapon, and the efficiency of the strike depends upon the maintenance of the closed shop. You can hardly conceive of a more un American, a more anti-American institution, than the closed shop. It is really very remarkable that it is allowed to exist by the sanction of law under the American flag. It tramples under foot the most sacred rights and privileges of the American citizen and sets itself openly and defiantly against that freedom for which the Anglo-Saxon has been struggling and fighting for centuries. The most sacred right and privilege that American democracy guarantees to the American citizen is the right to work anywhere under the American flag without fear and without molestation, and the right to sell the products of his labor, or sell his labor, or buy the products of the labor of others on an open market, absolutely unrestricted, at the best possible price.

They are not allowed to enter the markets they have arbitrarily circumscribed, and their fixed policy is to drive them out of every market in the country. They prohibit the employer from buying labor, or the products of labor, on an open market. He must get permission from them before he can employ anyone and he must discharge any employee in his factory, however valuable and however satisfactory, when they order him to do so. They deny to the employer, as well as to their own men, the right of freedom of contract. They prohibit the employer from entering into any sort of contract with any one of his employes. They prohibit the employer from dealing with his employes as men at all.

Strike Is a Minority Conspiracy

Up to a very short while ago practically every community in this country was self-sustaining. The country was composed of thousands of small communities, each largely independent of the others in essentials, and in a position to live without much assistance from the others. But, when the industrial revolution brought on by the application of steam to machinery and transportation struck this country, these simple conditions of industrial life passed away and we were transformed from a state of group independents to a state of group dependents. Through the workings of the division of labor made possible by the new industrial order, large scale production superseded small scale production and people everywhere were drawn in from isolated independent communities to become a part of a great industrial organism. This brought about a division of workers into a number of large groups, each group giving all of its time and energies to the performance of a fractional part of the great socialized productive process, and each group exchanging its work in its highly specialized field for its pro rata of finished goods into whose production the work of a hundred co-ordinate groups has gone. This means that each group is dependent on the work of the other groups for its life, and the life of the whole is dependent upon the functioning of each group in a specialized field. Industrial society under this new order has become a social organism.

The strike is not the exercise of any legitimate right guaranteed to the individual under American democracy. It is a conspiracy on the part of a small minority to throw the whole social organism into jeopardy and thus, by terrorism and threats against the innocent, force society to meet its arbitrary demands.

Barrett Everlastic Roofings

Better Roofs for Less Money

IF YOU want to find out how cheaply you can build a *good* roof, use Barrett Everlastic Roofings. They are easly laid and give maximum service at minimum cost.

They come in four different styles—two kinds of shingles, both surfaced with red or green crushed slate, and two kinds of roll roofings, one slate-surfaced, the other plain.

On residences and all other steep-roofed buildings, Barrett Everlastic Roofings enable you to build better roofs in less time and for less money.

Barrett Everlastic Roofings are carried by enterprising dealers everywhere.

When buying, look for the Everlastic name. It is your safeguard against inferior imitations.

Illustrated booklet describing the four styles of Everlastic will be sent free on request.

Everlastic Multi-Shingles.
(Four Shingles in One)

The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Single Shingles.

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8 x 12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing.

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing.

This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

I make it a rule never to write a grouchy letter—I telephone.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Architects taking bids, due August 14th. Standard Const. Co., 1713 Sansom street, Philadelphia, is figuring.

AS THE EDITOR SEES IT

(Continued from Page 716.)

It was the open shop policy of American democracy that awakened the genius and inspired the spirits of Andrew Jackson, poor orphan mountain boy; of Abraham Lincoln, the rail splitter; of Andrew Johnson the unlettered tailor; of James A. Garfield, the mule driver; of Andrew Carnegie, the office boy; of Thomas A. Edison, the telegraph operator; and of multitudes of others who have travelled the unobstructed road laid out by the founders of this great government from the bottom to the top. It has been the one great source of hope and inspiration and ambition to American boys, born in poverty and obscurity, from the earliest days of our country. Not in the interest of capital, not in the interest of employers, not in the interest of business primarily, but in the interest of the millions of poor little boys who are hanging on their mothers' aprons as the mothers go about their daily toil and who cannot speak for themselves, let's keep the door of American opportunity open for them and the road unobstructed that they may inherit the priceless privileges bequeathed to them by the founders of American democracy.

Walter F. Price
Architect
136 S. 4th St.
Philadelphia

Aug. 5, 1920

Editor of the
Builders' Guide,
Phila.,

Dear Sir:—

I want to say that I have read with great interest and hearty approval your Editorial in the Builders' Guide which came this morning. I am absolutely for the Open Shop.

Cordially yours,
Walter F. Price.

People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

Woodoleum Flooring

You are safe when you buy a Woodoleum Floor.

You get an absolute and unqualified guarantee. You get a concern which is the pioneer in this line of floor coverings.

There is but one Woodoleum—accept no imitation.

Woodoleum Mfg. Co.
131 Arch Street, Philadelphia

ROCBOND

is an exterior stucco, a magnesite composition adaptable to any stucco purpose.

Rocbond is fire proof, durable, clean and free from cracks and checks.

There is a Rocbond house in your neighborhood.

USG SHEETROCK

Makes Rigid, Warp-Proof Walls

WHAT is SHEETROCK? It is a sheet of pure ***gypsum rock,*** sheathed in a heavy protective covering. It is the standard wall and ceiling material in unit form.

Tough, rigid and durable, SHEETROCK resists heat, cold and sound. It can not warp, shrink or buckle. It stays put as long as the building stands. And—it is fireproof.

SHEETROCK also takes any decorative treatment: paper, paint, panels. Or it can be left in its own attractive finish of soft mist gray.

Another SHEETROCK advantage is the quickness, the economy, with which it can be put up. It can be sawed and nailed just like lumber; it comes in units of standard sizes, and the joining edges fit perfectly.

For new construction, alterations and repairs—you want SHEETROCK. We have it.

As The Editor Sees It

ELEMENTS THAT MUST BE CONSIDERED IN COST ESTIMATING

The subject "Cost Estimating" is of unusually wide scope as practically each type of contract work has to be analyzed on its own merits and is subject to special considerations. In all cases, however, the following elements enter and must be given consideration:

Financial Credit
Constructive Skill
Use of plant
Hazard
Profit.

Financial Credit.—The contractor should make a carefully prepared schedule of the amount of money which will have to be invested in the proposed work from the time he signs the contract until his final estimate is rendered, and from such schedule he must determine the amount of interest this money will cost and this amount is a proper charge against the work. If this is not done the contractor is merely contributing to the owner this amount.

Futhermore, a careful analysis along these lines will often disclose the fact that a certain piece of work requires a larger amount of money to handle it than is apparent at first glance, and such a condition might work a hardship if not a disaster on the contractor in spite of the fact that all other considerations had been taken care of. It is a notorious fact that on certain types of contracts, pay for preliminary work, which may be a large item, cannot be secured through the medium of the regular unit prices until the work has progressed well along to completion.

Constructive Skill.—Contractors enenaged in business are entitled to receive compensation in the shape of an annual salary for personal services rendered and it is our belief that any computations of cost should include sufficient amount to cover such salary whether it be that of a single individual or various members of a partnership or corporation. If this is not done the contractor is contributing his services to the owner without remuneration, because by no stretch of the imagination can there be any rightly considered profit except as over and above a reasonable salary allowance to the contractor himself.

Use of Plant.—This item justifies an independent discussion by itself and we suggest that the association appoint a committee to deal directly with it.

Hazard.—Many specifications include clauses which contemplate making the contractor assume risks which should properly be borne by the site, or in other words, should be at the owner's risk. In making a proposal on such work the conractor has two alternatives—one to protect himself in his proposal against such risks by special provision in his proposal, or secondly, to put a large value on any possible risk which he is asked to stand.

It may be well to add in this connection that while it ordinary behooves a contractor to be somewhat of an optimist he can well afford to be a confirmed pessimist when figuring this portion of a contract. It is possible this fact more than any other has caused good firms to have to go out of the contracting business.

Profit.—As to the necessity of a profit we can all be agreed. As to the amount which must be added as a percentage on the cost, differences of opinion will exist, but it must be remembered that the contracting business is a particularly hazardous one; that it is irregular in volume and that every contract will not necessarily be profitable.

Futhermore, it must be remembered that the average merchant sells goods from his shelves at a profit with a definitely established costs for the goods themselves. The manufacturer sells on short term contracts—his overhead, plant installation and plant maintenance costs are established and regular, and while he may not in all cases be willingly to admit it, the manufacturer is practically working on a cost plus basis today. The only difference in most cases between his method of fixing prices and that of a cost plus construction contract is that the manufacturer can and does add a larger profit for the use of his organization,

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

brains and energy. The contractor must provide his plant, must guess at the cost of it, in place, must guess at the operating cost, must guess successfully if he is to stay in the business as to what the labor market will be, and if he is willing to do this he is surely entitled to a fair margin of profit.

Necessary Factors in Estimating.—The following items also enter into most work and must be in detail before the preliminary cost of a piece of work can be considered as complete:

Interest.
Overhead expense.
Bonds.
Insurance—Employers' liability. Public liability. Fire Insurance.
Special risks.
Freight on outfit to and from work.
Moving in and out.
Land damages.
Camp and other buildings.
Preliminary work.
Cost of materials plus freight.
Hauling materials.
Supervision.
Labor.
Loss on board.
Transportation of labor.
Tools.
Plant rental.
Supplies.
Running repairs.
General repairs.
Special.
Machinery.
Fuel and power.
Water.

Taking up these items in order we will comment briefly on each:

Interest.—This is covered in our discussion of financial credits.

Overhead.—A contractor should establish the proper cost of the overhead charges in his business. This should include the charges, salary allowance for members of the firm, traveling expenses, etc. Provision should also be made here for the maintenance of an equipment storage yard.

Bonds.—No comment should be necessary here on this item.

Iinsurance.—It is not necessary to make a discussion of the ordinary items, but we wish to call attention to the fact that prudence would require that any conbustile material, together with camps, storehouses, etc., should be insured and such insurance is of course a proper item of cost to the work. There are often special risks which occur upon a job which may be protected by insurance, and such insurance is also part of the cost.

Freight on Outfit.—This is probably a portion of the item following, but we have listed it separately because we believe that many contractors under-estimate the amount of freight that they will be required to pay on their outfits in such cases.

Moving in and Out Expense.—This is an item frequently overlooked, by contractors, but one which requires careful consideration. First, there is expense of loading outfit in the contractor's yard; second, the unloading of it at point of destination; third, the moving of it perhaps many miles across country; fourth, the setting up and getting plant ready to operate, and the reverse of all these operations until the plant is again delivered in the contractor's yard.

Land Damages.—This is an item which we believe many contractors neglect entirely and still is one which cost considerable sums of money. This seems particularly true in connection with county road work.

Land damages accrue from the use of property for camping purpose, from moving outfits across fields for the diversion of public highways, and for storage yard and other construction layout.

Camp and Other Buildings.—This is another fruitful source of underestimating by contractors, often in loose assumption that "The boarding house will pay for the camps." If such a condition ever existed it must have been a great many years ago and we believe that present day conditions necessitate including the cost of all camps and temporary buildings required to carry on the work. We further believe that contractors should be careful to avoid the thought of high salvage values to avoid subsequent disappointment.

Preliminary Work.—This is an item which should not only be considered in cost estimating, but we believe that we should digress from the subject for a moment and call attention to the fact that it is probably a duty which every contractor owes to himself to work out a definite scheme of handling a piece of work before he proceeds with an estimate. This does not mean that he must detail the laying out of an entire piece of work but that he must see clearly that a certain general line of procedure can be followed with expectation of proper results therefrom.

Cost of Materials.—Mention is made of this particularly to emphasize the fact that a cost estimate is usually based on certain material quotations, and it is very necessary in these times that a prospective bidder should be careful to be properly covered with material quotations when making a bid and to close up promptly with the material dealers after the award of the contract.

In connection with this comes a question of freight which must not be overlooked, but in case of the present railway situation it would seem necessary for every bidder to make special provision in his proposal to protect against a change in freight rates during the time of the work.

Hauling Materials.—All hauling costs should be very carefully analyzed, as they are often a fruitful source of underestimation.

Supervision.—Care should be taken to see that any computation of labor also includes any supervision which is not covered in the item of overhead. This

(Continued on Page 743.)

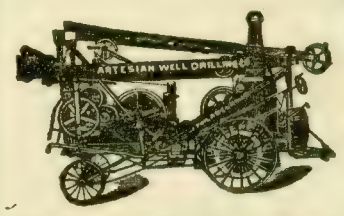
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.



This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

18x90 feet, slag roof, brick foundations, pine floors, hardwood floors (hot water heating, electric lighting reserved), tile work, hollow metal sash, plumbing, metal bulks, fire escapes. Architects taking bids due August 18th. R. B. Mason, Christian R. Richter, E. Eyring & Son, Frank Herbert and George Schnader, all of Baltimore, Md., are figuring.

Laboratory, Providence, R. I. Architects, Day & Klauder, 925 Chestnut street, Philadelphia. Owners, Brown University, Providence, R. I. Brick, 3 stories, 50x300 feet. Preliminary sketches in progress. Too early for details.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., August 12, 1920. Sealed Proposals will be received at this office until 3 P. M., September 3, 1920, and then opened, for new mezzanine floor in Post Office, Scranton, Pa., in accordance with drawing No. M. C.-73 and 325 and this specification, copies of which may be had at the office of the Custodian or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

AS THE EDITOR SEES IT

(Continued from Page 732.)

would usually mean general foreman, timekeepers, labor agents.

Labor.—Labor is perhaps the most difficult item in the computing of cost which a contractor has to deal with. Rates have been rising for several years and it is apparent that wages have not reached their peak. Provision must be made somewhere to protect against what the bidder considers the maximum rate which will accrue during the life of the contract.

Loss on Board.—In most cases there is a definite board loss in connection with camps. While this may not be true with large camps, working through a considerable period of time, the small movable camp such as in vogue on highway work usually contributes a constant loss to the work.

Transportation of Labor.—This is an item very often neglected, yet it is very common to have to advance railway fare to laborers with the resulting increase in the cost of work.

Tools.—Contractors often fail to make the proper allowance for tools. Careful analysis of work done will show that a tool item is a very appreciable one in every contract and will also indicate that tools do not carry any too well from job to job but there is a definite and heavy loss on every job in connection with this item.

Plant Rental.—As mentioned before this should be covered by special paper.

Supplies.—This is an item which is often neglected as being a minor consideration. On certain classes of work it is really, instead, a very heavy item. The cost of packing, grease, hose, rubber boots and other rubber goods, should be given careful consideration and the contractor will save himself money by checking up his past work and arriving at a clear understanding of what such costs really are.

Runining and General Repairs.—These should be discussed in connection with the use of plant, of plant rental, but in any case the contractor must understand that they are necessary parts of the cost of doing a piece of work.

Special Machinery.—On many contracts it is necessary to employ in addition to an ordinary contractor's plant some special form of machinery either purchased from a manufacturer or built by the contractor for the work. In either case plant rental is not a proper charge for this class of equipment. The entire cost of it less its scrap value must be charged to the one job on which it is used, otherwise a contractor may complete a large amount of work and find the

Woodoleum Flooring

You are safe when you buy a Woodoleum Floor.

You get an absolute and unqualified guarantee. You get a concern which is the pioneer in this line of floor coverings.

There is but one Woodoleum—accept no imitation.

Woodoleum Mfg. Co.

entire profits tied up in machinery which has little value other than scrap.

Fuel and Power.—The cost of power especially varies so much in different localities that the bidder should acquaint himself carefully with the local conditions. If a large amount of fuel is involved careful allowance must be made for the hauling and handling of the same.

Water.—This item often becomes a serious obstacle to the proper handling of work and is one that reguires a great deal of attention. It sometimes adds very materially to the cost. In addition to this we wish to impress all contractors with the desirability of investigating the available water supply in connection with a given piece of work before making their figures.

Cost Keeping.—We cannot close the discussion of cost estimating without dwelling for a moment on the question of cost keeping. The fact that so many contracting concerns are closed out of business each year is a strong indication that something is not correct with the way construction work is figures. A good deal of it comes from neglecting a number of items which we have mentioned above and which do not appeal to some men as being of enough moment to give direct consideration to when making figures. Other trouble comes from not keeping careful cost data of work done and analyzing such costs.

It is not the purpose of this paper to go into detail regarding such things, but we believe that a contractor should avoid using manufacturers' statements of operating costs as wel as any other stop-watch methods, as they usually spell loss if not disaster. A certain amount of work done per day with a crew operating at a certain expense per day never means that the division of that daily cost by the daily output is the unit cost of the item in question. There are delays and other things which so affect this price that it may be over one hundred per cent out from the actual cost when all things are taken into consideration.—*Associated General Contractors Bulletin.*

TRENCH CAVE-IN KILLS WORKER

BY J. J. ROSEDALE, CONSTRUCTION ENGINEER.

While a laborer was excavating a trench for the foundation of a four-story building in the city of San Francisco, the 2-inch sheeting collapsed, burying and crushing this worker to death.

Upon arriving at the scene of the accident it was found that the San Francisco Fire Department was enaged in rescuing the deceased, and after two hours of strenuous work succeeded in extricating the body from the bottom of the trench.

The trench was excavated at the side of an adjoining wall of a building in a loose sandy loam soil to a dept of 10 feet and had been opened up for a distance of about 60 feet. A width of 3½ feet had been maintained throughout its length. The trench was sheeted with 2-inch by 8-inch planks 8 feet long, placed horizontally and supportd by 6-inch by 6-inch vertical posts spaced 8 feet center to center. These posts only supported the sheeting at the ends and left 7 feet 6 inches of the sheeting unsupported between each pair of vertical braces. The horizontal strut braces supporting the vertical posts consisted of only 2-inch by 4-inch scantlings placed near the top of each post and none were placed in the middle or bottom of the trench. These horizontal braces were placed loosely between the posts and wall of the adjoining building, and were of no value as supporting elements. Owing to the considerable pressure in the center of the sheeting between each pair of vertical braces, and inadequate horizontal strut braces to support these vertical posts, the trench caved in.

This accident should have been avoided if the following precautions had been taken:

The vertical posts should have been placed at least 5 feet on centers and supported by 4-inch by 6-inch horizontal strut braces, placed at least 3 feet on centers and normal to both the wall and vertical braces, cleated and rigidly wedged. This method should have afforded ample protection against a cave-in and would have only increased the cost $25 for sheeting and bracing the trench, and saved a life and $4,446 which was paid the widow for compensation.

—*Architect and Engineer.*

PEP PARAGRAPHS

Plums fall to those who go after them.

Get a bead on the target, then blaze away.

It takes a lotta pull to push some boobs ahead.

Confidence is half the battle; the other half is action.

If work were half as popular as play, we'd all be happy and gay.

Most people grade about the same as the roads along which they live.

Many a man's more interested in how he's sold than in what he's bought.

You can't sail straight through an island, but y ou can tack around it.

Don't start up a blind alley; go where you can see something ahead.

What you don't say frequently is of more importance than what you do.

It's said that woman always has the last word, yet it's always man that reminds you of it.

It's true that some kinds of work are of more importance than others; but the guy who can't see the importance of another fellow's work is a pretty poor excuse of a man.

(Copyright, 1920, by S. A. Chandler.)

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

As The Editor Sees It

ARCHITECTS and the Building Trades are appealed to in an effort to help in the glass situation. All can help. Insurance premiums are cut heavily by co-operation with companies.

If architects, says the *Eastern Underwriter,* could be brought to a realization of the unusally unsatisfactory conditions in the plate glass manufacturing field, and would draw their plans accordingly, much heavy expense and serious trouble might be saved owners of stores and mercantile establishments. Glass is now so excessively expensive and insurance premiums so high in consequence that unless property owners are to be saddled annually with an added and unnecessary expense, more consideration must be given to the size of plates used and the manner in which they are set.

The craze for large lights in stores and for large elaborate fronts in which clamped glass is used, is still indulged in to a surprising extent, in view of the practical impossibility of obtaining glass of the size necessary to make replacements.

Insurance companies that insure glass have at their disposal much valuable information concerning the cost of various sizes of glass and what might be saved by property owners if they could be induced to use sizes within certain limits. Also, they can tell how the use of certain sizes and setting them in various ways will affect the glass insurance premiums. In a surprisingly large number of cases an apparently slight difference in the method of designing a store front would save the owners many hundreds of dollars in insurance premiums and at the same time render him far less susceptible to loss and annoyance. Particularly is this true now when glass is so difficult to obtain.

The insurance companies stand ready and willing to give this information to architects and property owners if they would co-operate with the insurance companies when contemplating new work or alterations.

Plate glass insurance premiums have been advanced more than 300 per cent and the insurance companies are not to blame, because the price of glass has gone up in greater proportion than have the premiums. Fortunately for the companies they now have the means of knowing, through the investigations of an expert rater just what their losses are in given localities and on specified types of glass settings. They are prepared to give valuable advice concerning whether certain installations are advisable in a given location. They know now more nearly than any other time in glass insurance experience what rate they should get for various kinds and sizes of glass.

The companies are losing business every day because of the high rates they find it necessary to charge. There isn't anything the companies would welcome more than a reduction in the cost of glass, so that they might begin a downward revision of their rates. Even where companies are confronted with the loss of business they now believe that it is better to let the business go than to accept it at a reduced rate. In the West the Lion Bonding & Insurance Company is accepting business at reduced rates. It is one of the few companies that does not follow the rates in use by 99 per cent of those in the glass insurance business.

There are many opinions among glass insurance men as to just why glass is now so high. Some charge it to speculation. However, the condition exists and there appears no immediate relief, so the only solution of the difficulty seems to lie in co-operation among insurance companies, property owners and architects to so lay out plans that breakage will be reduced to the minimum and replacements be made possible, if not easy.

Plate glass is now being sold to the highest bidder, practically. This is particularly true of the larger sizes. A large light is worth anything the manufacturer or jobber can get for it. There is no market, one may say. Insurance companies find it difficut to do business with manufacturers direct. They often have to do business with others, which leads to the opinion that prices are being

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

manipulated by speculators. Besides there is the tremendous uncertainty in deliveries, the difficulty in having glass set and innumerable annoyances all along the line.

Getting back to architects; if they would use their influence with property owners to have smaller lights put in and the glass placed in substantial settings, they could do much to relieve the situation. Most architects do not realize how much a property owner might save by using lights of a size more easily obtainable in the present market. Take, for example, a light 144 x 184 inches. The annual insurance rate on this light would be $441.60, to which must be added 25 per cent. for replacement with but one light. This makes the premium $552.20.

Now suppose that this light could be replaced with two 92 x 144 inch plates. Each of these smaller lights could be insured for a premium of $31.24, or $62.48 for the two. This is just about 12 per cent of the premium for the one big light.

Insurance agents who wish to render a real service to property owners could not do better than inform their clients of the methods by which they may avoid excessively high insurance premiums and also reduce the likelihood of breakages and long delays in making replacements. Such service comes distinctly within the province of a live insurance agency.

Many glass insurance companies are encouraging the splitting of big lights, and some property owners are having it done, notwithstanding that they prefer the large lights. This splitting of existing glass store fronts is sometimes done horizontally and sometimes perpendicularly. The former is preferred by insurance companies, as they consider that it looks better and is less noticeable from the street. They advocate what they term a landscape line. This is effected by a bar of sufficient strength inserted horizontally about two-thirds up from the bottom of the light. This takes the break out of the line of vision of those in the street who view the contents of the window.

It does not cost much to make these splits. It may be $10, $15, $25, and in extreme cases $50, according to the setting of the glass, the woodwork finish and other conditions. But in any event the cost is so small as compared with the difference in insurance premium, as to make the proposition highly attractive to owners who might be seriously inconvenienced if a large light broke.

In New York today it is almost impossible to get large lights, and when they are obtained, the price may be any way from $1,500 to $2,800. The insurance companies are steadily refusing to write this class of business and, where it is taken, they insist upon a clause in the policy permitting them to replace with two lights instead of one. Where one light is insisted upon, 25 per cent is added to the rate, but this doesn't do the insurance company much good. The advance is too small considering the extra risk assumed. It is noticed that while many houses are refusing to carry plate glass insurance at the present high rates, others who never carried it before are coming into the market. They become frightened when they realize what it would cost to make replacements.

THEATRE BUILDERS GET REQUIREMENTS

Specifications for architects and builders regarding the construction, alteration or repairing of buildings in which public entertainments are given were issued August 1st by Clifford B. Connelley, commissioner of labor and industry. They are drafted from the provisions of the state's laws and apply to theatres, motion-picture houses, auditoriums or any public halls where stage scenery is used.

It is provided by the specifications that the location must be suitable for the purpose, and that no steps will be allowed at the entrance of exits others than one of eight inches rise, because of weather conditions. All other differences in elevation between the floor and ground level must be overcome by means of inclines which cannot exceed one foot rise in ten feet. If side and rear courts are necessary, they must be not less than five feet wide in the clear, and they must lead to a street or alley. All doors opening into the courts must be made to swing flush within the wall.

Exits cannot be less than five feet in width or more than six feet wide in the clear. They must have out-swinging double doors, equipped with approved panic locks. The colored illuminated "exit" sign must be placed at each door. All aisles having seats on both sides must not be less than four feet wide in the clear and wall aisles must be at least three feet, six inches wide. Cross aisles must be five feet wide. It is provided that there shall not be more than six seats between any one seat and an aisle and not more than fourteen seats between any two aisles. Seats must be eighteen inches between the arms and thirty inches from back to back of rows. They must be fastened securely to the floor and the front rows cannot be closer than twelve to the screen, and the rear seats five feet from the foyer wall.

The specifications provide that picture booths be constructed to conform with the motion-picture act of 1919, and that wiring must be done in accordance with the electric code and rules of the Underwriter's Association, while the stage must conform with the fire and panic act of 1909. Galleries must be constructed according to general requirements, and in buildings hereafter erected means of egress must be within the walls of the building. Plans for these buildings must be submitted in duplicate to the Department of Labor and Industry for approval.

(Coninued on Page 758.)

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

U.S. SHEETROCK

THIS UNIT WALL MATERIAL TAKES WALL PAPER TO PERFECTION

YOU can leave SHEETROCK in its own attractive finish of soft mist gray. Or you can have it papered, painted or paneled. It takes any decorative treatment.

SHEETROCK, being a sheet of pure ***gypsum rock,*** encased in a heavy protective covering, is fireproof and can not warp, shrink or buckle. It resists heat, cold and sound.

Naturally then, the use of SHEETROCK will not only add to the beauty, safety and comfort of your home; it also insures lasting economy—on alterations and repairs as well as for new construction.

Let us show you how easily SHEETROCK can be sawed and nailed; how quickly it can be put up. Drop in and see us today.

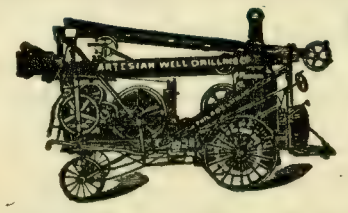
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Garages (28), Fox avenue, Philadelphia. Architect, B. H. Lackey, 509 Federal street, Camden, N. J. Owner, J. L. Schmidt, 3038 North Twenty-fifth street, Philadelphia. Brick, 1 story, 12x17 feet each, slag roof, concrete floors, electric lighting, corrugated iron partitions and steel. Contract awarded to W. D. Speece, Glendora, N. J.

Miscellaneous Construction News

Group of Buildings, Massachusetts avenue, between Twentieth and Twenty-first streets, Washington, D. C. Architect, Snowden Ashford, Municipal Architect, District of Columbia, Washington, D. C. Owner, Gallinger Municipal Hospital, Louis Brownlow and Charles W. Lutz, Commissioners, District of Columbia, District Building, Washington, D. C. Brick, stucco, stone and steel, 2½ stories, Administration Building, 65x127 feet, wing 149x45 feet, Building for Mentally Defective Women, 112x52 feet, wing 26x44 feet, wing 101x30 feet, Building for Mentally Defective Men, 112x52 feet, wing 26x44 feet, wing 101x30 feet, stone and concrete foundations, slate, tile and slag roof, cement, maple and terrazzo floors, marble work, hollow tile, metal lath, elevators, rolled steel skylights, roof ventilators, metal weather strips, waterproofing, dampproofing, iron stairs and work. Bond. Owners taking bids due September 8th. Standard Const. Co., 1713 Sansom street, Philadelphia, are figuring. Deposit of $5.00 required.

Dispensary and Employment Office, Sparrows Point, Md. Architect, private plans. Owner, Bethlehem Steel Company, Sparrows Point, Md. Brick and steel, 1 story, 115x35 feet, stone foundations, slag roof, tile and concrete floors, steam heating, electric lighting, metal lath, metal ceilings. Owners taking bids due August 26th. Irwin & Leighton, 136 North Twelfth street, Philadelphia, are figuring.

Proposals

PICATINNY ARSENAL, DOVER, N. J.—Proposals for erection of two manufacturing buildings, viz.: one of steel and wooden frame and one of wooden frame, sidings on both to be of wooden sheathing and corrugated iron, material furnished by the United States, will be received until one o'clock P. M. September 1, 1920. For forms, drawings and specifications apply to Commanding Officer.

AS THE EDITOR SEES IT

(Continued from Page 748.)

Theatres seating fewer than 251 persons shall, in addition to these requirements, have two five-foot exits in front and two of the same size in the rear. Houses seating fewer than 501 and more than 250 shall have three five-foot exits in front and two six-foot exits in the rear. Theatres seating fewer than 1001 and more than 500 shall have three five-foot exits in front and twenty inches additional for each 100 or fraction of 100 persons over 500, two six-foot exits in the rear and two five-foot exits placed one on each side of the theatre.

SIMPLE CONCRETE PAVING IN RESIDENCE WORK

BY E. S. LARNED, CEMENT AND CONCRETE SPECIALIST

IN the development of residential property, concrete has come into such a general use and possesses so many advantages over the materials of construction which it has supplanted, that an argument in favor of its continued use has become unnecessary.

By reason of this extensive use of concrete, there has been a material change

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

in the number of artisans engaged in the other classes of masonry work, and in many communities today it is hard to find the old time stone mason who is skilled in laying up cellar walls, and now, when foundation walls are laid up with rubble masonry or field stone, they are often inferior because of the lack of skill on the part of the workmen and, at best, the rubble wall was never so dense and impervious to moisture as a concrete wall.

Notwithstanding the many advantages that concrete possesses, it must be remembered that concrete is a manufactured article, and that all the materials entering into its makeup must be selected with discrimination, and then combined in proper proportions and mixed and placed with reasonable care. This is all very simple, requires little skill except on the part of the man directing operations, and the result is known within a very few days after the work is in place, so that poor materials or poor workmanship cannot be covered up or disguised.

It may be correctly said today that Portland cement is made under a standard specification, is remarkably uniform in quality and, except in color and some minor physical qualities, recognized only by the expert, there is little difference to be found between the various brands offered by manufacturers of established reputation.

Concrete Aggregates. Having selected a cement of standard reputation, we will now consider the importance of securing suitable sand and suitable stone or coarse aggregate, which go to make up the concrete mix.

Sand. Most communities afford sand differing widely in quality and suitabilty for this class of work, and as a general thing the sand used has more influence upon variations in the strength of the concrete than has the cement.

A suitable sand should, first, be clean and free from loam, clay and any impurities and contaminations of organic or chemical nature. It is commonly required that the sand shall be screened through a ¼ inch mesh sieve and that the particles shall be graduated in size from fine to coarse, with the coarse grains predominating; in other words, a clean, sharp, gritty siliceous sand. If only a fine sand of uniform grain is obtainable, but still clean and free of impurities, it is necessary to enrich the proportions by adding more cement than would be required in the case of the graduated coarser sand.

Coarse Aggregate. In work of small dimensions, such as sidewalks, curbs, steps, and driveways, the coarse aggregate should consist of either clean screened gravel, ranging in size from ¼ to 1½ inches or 2 inches in diameter (and it is important that the gravel stones be not coated with earth or clay) or have a clean hard crushed stone, having the same range in size and being free from dust, dirt or any foreign substance.

Mixing. Having determined the proportions, the materials should be carefully measured out and, if mixed by hand, the best results are obtained as follows: First provide a tight smooth mixing platform about 10 feet square, spread the measured quantity of sand on this to a depth of about three or four inches, spread the cement on top, uniformly and then with shovels or hoes turn this over thoroughly until the sand and cement are thoroughly intermixed dry, then add sufficient water to produce a paste or mortar of mushy consistency, then the measured quantity of stone or gravel is spread on the board to a depth of about 4 inches, sprinkled or wet with a hose, the mortar carefully spread over the surface of the stone and then all materials turned over, using a square pointed shovel, and shoveling to the surface of the board each time, so that the mortar is distributed through the voids of the stone, completely coating each particle. The concrete is then, without delay, placed in the forms, lightly worked with a spade or slice bar to secure smooth faces, in effect, puddling the concrete.

If the concrete is to be mixed by machine, it is common practice to put in, first the stone, then the cement and then the sand, adding the required amount of water to produce a concrete of medium soft consistency. It should remain in mixer at least one minute before discharging.

Forms. If smooth finished work is desired, it is necessary to use sound, straight lumber, planed at least on one side, and preferably tongued and grooved to prevent the leakage of cement grout. The form should be carefully braced to prevent bulging and lined up to conform to actual dimensions required. In the case of cellar walls, where building ordinances do not fix the dimensions, the thickness of wall for the ordinary dwelling house should not be less than ten inches.

Forms for sidewalks and driveways are very simple. It is customary to use lumber not less than two inches thick, the top edge to be carefully set to line and grade and securely held in place by stakes or iron pins, set on the outside of forms. If the sidewalk has no longitudional pitch for drainage (and this when obtainable should not be less than ¼ inch to the foot) the center of the walk should be either slightly crowned, or one edge set higher than the opposite edge, to provide the necessary drainage; the same conditions would apply to driveways.

Jointing. It is common practice to divide the sidewalk into blocks or squares not exceeding 36 square feet and in proprocess of construction, the concrete is cut along the joint lines entirely through from the surface to the bottom, (this is

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

commonly done with a trowel working along a straight edge) and when the surface is finally finished by means of either a wood float or a steel trowel, the joint lines are finished with a tool called a jointer, leaving a straight beveled edge along each side of the joint, and the edge of the sidewalk is also given a beveled finish.

The modern specification for sidewalks requires not less than three inches of concrete in the base course, and one inch of mortar finish, which is applied immediately after the base course is laid, in order that the two mixtures may thoroughly **bond.**

In the case of *driveways* (not public roads) no special mortar finish is required, and the entire thickness of the concrete may be from 4 to 5 inches on the edge and with a crown of ¼ inch to the foot, having a mid depth of 5 to 6 inches in case of an 8 foot driveway, 5¼ to 6¼ inches in the case of a 10 foot driveway, and 6 to 7 inches in case of a 16 foot driveway, the foundation being finished to a flat surface. In order to finish the surface of a concrete roadway, it is customary to have a templet or strike board, the bottom edge being sawed to the crown of the road, and in length it should be about 2 feet longer than the width of the road; this is pushed forward, bearing firmly on the side forms, in a zig-zag motion, forcing the surplus concrete forward and leaving a relatively smooth surface; this is then commonly finished with a wood hand float which serves to completely embed the stones below the surface and leave a smooth finish. If it is desired to score this in any way, or mark it, it may be done by lightly brooming over the surface, drawing the broom in straight lines to produce a pleasing effect. In the case of a driveway of 8, 10, 12, or 16 feet width, there need be only a transverse joint about every 20 feet.

Joints for driveways may be made as suggested above for sidewalks, but perferably by the use of end forms or bulkheads, which may be made of thin boards sawed on the top surface to conform with the crown of the road, and when using these, the slabs are cast in alternate sections and when the concrete has hardened, the bulkhead may be withdrawn and the intermediate sections filled in. It is often the practice that some filler be used in these transverse joints in the nature of three-ply asphaltic roofing paper or a prepared mastic may be obtained, but either of these fillers can be omitted.

Basement or cellar floors. Concrete for this work in the ordinary dwelling house should be not less than 3 inches in depth and preferably four. The concrete is spread in a solid sheet without joints, and it is often customary to give the surface a slight pitch to some point of drainage, if no trouble from ground water is to be expected, in which case a strainer is set in the slab over a dry well, which may be about 2 feet square, and the same depth filled with broken stone or cinders. If ground water has to be reckoned with, or, in the spring months, when there might be danger of seepage, of course no drain or opening in the floor surface would be introduced and every care should be exercised to make the work water tight. Good workmanship will accomplish this, using a concrete in the proportion of about 1 cement, 2 sand and 3½ stone, making sure that the entire floor area is covered by one day's operation, so that there are no joint lines in the concrete. If footings have to be provided for the basement columns, the foundation can be laid to the grade of the under side of the concrete floor, in this manner avoiding joint lines between the floor slab and the concrete footing. It is also necessary to make a very careful joint connection between the floor slab and the wall, and in joining new concrete with old it must be remembered that the old concrete must be thoroughly cleaned and moistened, and then preferably given a light coat of rich mortar at the same time as the floor slab is cast--this to insure a good bond.

Foundation Conditions. In preparing the foundation the one thing to guard against is frost action, and this trouble is influenced largely by the nature of the soil and by moisture conditions. If sidewalks, curbs and driveways are built on a sandy or gravelly material, no special preparation of the foundation would be generally required but, if the ground be clay, hard-pan or ordinary sub-soil, it is customary to excavate 12 inches below the bottom of the sub-base concrete and lay a foundation consisting of broken stone, screened gravel, or soft coal cinders, thoroughly rammed.

Reinforcement. No reinforcement is required in the ordinary sidewalk or driveway construction, but if curbs are subject to the shock of wheeled vehicles, there should be two rods of about ½ inch diameter, placed in the concrete near the bottom of the curb and two of the same size about 2 inches below the top of the curb. If the curb is likely to suffer very rough usage, the edge on the road side can be protected by beveled steel plate which is fastened to the form and cast in the concrete at the time of construction.

Cellar floors require no reinforcement, and in the ordinary foundation walls, reinforcement can be omitted, but if there is any danger from earth or water pressure, the walls may be reinforced by the use of ¾ inch vertical bars, spaced about 12 inches apart and set in the forms about 2 inches from the inside face of the wall and extending from the bottom of the footing course to the top of the wall.

In the case of steps which are cast as beams, supported by the side buttresses, each step should have, about 1 inch above the bottom, two reinforcing bars of from ½ to ¾ inch diameter depending on the span.

Contractors handling even the simplest concrete work should be careful to select only good materials and supervise the workmanship. Low first cost is oftentimes the highest ultimate cost to the owner, and long after the owner has forgotten the price he paid for a job he remembers the man who did the work, and if it turned out to be poor, such remembrance is not a good thing for the contractor. The general appearance of a properly finished job more than compensates the owner for the slight additional expense and insures a reputation to the contractor that is worth many dollars.

—Builders' Journal.

ARTHUR BRISBANE, in a recent issue of the *Herald-Examiner,* offers the following suggestion on encouraging house construction:

"In great cities few houses are built and the housing problem grows worse, because:

"Building is done by contractors with money borrowed on mortgage. Rich men won't take 6 per cent mortgages and hand back half of the interest to the government in income taxes when they can buy city bonds and other tax free securities.

"How would this do as a makeshift remedy while waiting for city and state governments to build houses and sell them to the people at cost plus interest?

"Let the cities issue bonds and lend the proceeds to builders for mortgages on first-class property at a reasonable rate of interest. The mortgage would pay his interest to the city, and the city would pay nothing for national income tax since the United States does not tax city bonds or city income. Rich men that won't lend on ordinary mortgages would gladly buy the tax free city bonds.

"Wouldn't that help the situation? Beating the devil around the stump, it is true, but the people need houses."

As The Editor Sees It

Abnormally high lumber prices were in part responsible for the arrest of the housebuilding movement within the last few months, according to a report submitted recently to the Senate by the Forest Service of the United States Department of Agriculture.

During the latter half of 1919 and the early months of 1920, says the report, lumber prices in the United States increased more sharply and to far higher points than were ever known before. In March, 1920, average mill prices had increased 300 per cent. and more over 1914. While the costs of production and distribution of lumber likewise increased, the rise in lumber prices was wholly disproportionate. "Present prices, though somewhat lower, are still excessive and yield profits unjustified by costs" says the report.

"A shortage in housing accommodations that is almost world-wide has brought home vividly the close relation of building to the comfort, health, and general welfare of the public. When for any reason construction falls below normal, overcrowding, high rents, lowered standards of living, and other evils follow."

Makes Construction Venturesome

Lumber prices, however, do not tell the whole story. Difficulty and delay in securing material and the impossibility of getting many of the grades desired tend to make the construction of a home at the present time a highly uncertain and speculative venture and take it out of the reach of large numbers of people.

According to figures of the United States Housing Corporation, the report states, normaly 30 per cent. of the number of buildings constructed are dwellings. In 1919, however, dwellings were only 15 per cent. Even before the war one million families in the United States desired houses. In 1919 only 70,000 houses were built, when 500,000 were required to meet the demand. In 1918 house construction was still less than in 1919.

An example of the increase in the cost of lumber, it is stated that the Pittsburgh home builder of 1913 paid $27 per thousand board feet for No. 1 common dimension framing. In 1920 he paid $72. Sheathing lumber No. 2 common yellow pine cost $26 in 1913 and $80 in 1920. Yellow pine finishing lumber increased from $42 to $140. If plain oak finish was used instead of Southern pine it cost $85 in 1913 and $260 in 1920. Yellow pine siding rose from $36 to $120; B and better flat grain flooring from $38 to $142; plain oak flooring cost, in 1913, $70 per thousand feet, and in 1920 $290; and quartered oak rose in the same period from $102 to $352.

A Few Striking Examples

The total costs of houses has increased proportionately, the report states. "A frame house built in Washington, D. C., in 1917 for $6,250 is now being duplicated from originial plans at a cost of $12,250. A St. Paul architect reports that a house was built for $4,240 in 1915, not including plumbing, heating, and wiring, and that a house built from the same plans in October, 1919, cost $7,724, while for identical plans in February, 1920, the cost rose to $11,820, or 179 per cent. over the 1915 price. The lumber and millwork costs in 1920 were $5,039, or $799 more than the total cost of the house in 1915. All of the items increased in 1920 over 1915, but with the exception of an insignificant item for a bond the percentage increases for lumber (304 per cent.) and millwork (222 per cent.) were the highest. On a six-room frame house built in Washington, D. C., for $4,771.60 in 1913 bids on identical plans in May, 1920, total $11,465.50.

"The lumber for a ready-cut, one-story, five-room house which was listed at $883 in 1915 had been raised to $3,272 in April, 1920, a total increase of 270 per cent.," says the report. "Another company dealing in ready-cut houses listed the material for a two-story seven-room house at $1,995 in 1915 and now lists it at $5,606.90, an increase of 181 per cent."

Can Not Afford To Pay Prices

Some kind of industrial construction can go forward regardless of uncertainties and cost, but ordinary homebuilders cannot afford to pay the lumber prices which are now asked.

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

This conditions of affairs is partly due, the report points out, to the depletion of the timber supply of the country. One after another the great softwood forests of New England, the Lake States, and the South have been attacked, and successfully diminished. For the last 20 years or more material from long-leaf pine from the South has held a dominant place in the market, but the end of the stand of Southern Yellow Pine is now in sight and within 10 years' time the South will produce no more lumber than it will need to satisfy its own demands. The only remaining large supply of softwood timber in the country is that of the the Pacific Coast and already this is being called upon to make up the deficit in the Eastern markets caused by the failure of forest regions closer at hand to supply adequate amounts.

It is pointed out by the report that there is enough land in the country not adapted for any other uses to produce an ample amount of timber for all the needs of the country, if it were stocked with trees. At the present time forest fires cause an immense damage each year and prevent young timber which is already on the land from making its best growth or from producing timber of good quality. The only way in which an extreme shortage of lumber with all its attendant evils and restrictions on development can be avoided, the report insists, is by the adoption of a well co-ordinate policy of timber growing which will combine the efforts of the Federal Government, the States, and private individuals, with emphasis laid first of all on stopping the destruction wrought by forest fires.

* * *

Although high lumber prices were in part responsible for the arrest of house building, the effect of increased freight rates on lumber prices will not be downward.

The contention of railroad workers and their leaders and perhaps of labor leaders in general, says the *Lumber Trade Journal,* that the public will not, or at least should not, have to pay the increased cost of freight in the long run is perfectly understandable. That is the correct politics of the business, from their point of self interest.

But we fail entirely to understand the same or similar comments recently coming from various other sources occasionally, if not frequently, such as railway officials or higher-ups, economists, editors or publicists, and even some government officials and a few bankers. Just how authoritatively the latter may be, except in the case of Government officials, it would not on the whole be easy to say, but their comments stand and get into the record.

You don't find the commercial agencies making any such loose statements or repeating such follies. Note Dun's' for example, which says "the rise in freight rates may retard the progress of deflation in some lines, but other elements are depressing prices further and further."

That means, if it means anything, that the rate increase does have a direct bearing on the price, and the comment is all the more striking because it is incidental, being thrown in and assumed inferentially as a matter of course in illustration of entirely another matter, that of price reaction speaking generally. Dun's assumption is perfectly logical and correct, and deflation of prices will be retarded by an exact equivalent of freight increases, and this is borne out by some of the more level-headed daily papers.

As one editor puts it, it doesn't make any difference whether a railroad president says it, a labor union "expert" says it, a superficial editor says it, or who says it, a declaration that the railway rates are scarcely distinguishable in the public's cost of living is false in mathematics and preposterous in economics. This is supplemented by the statement more forcible than polite, but thoroughly well deserved:

"On the census basis of five persons to the average American bread winner's family this means a bill to him of $375 a year. Anybody that thinks an incessant tax of more than a dollar a day isn't distinguishable in the expenditures of the average bread winner of a family isn't doing his thinking with his head; he is doing it with his mouth."

All possible comments to the contrary are illogical, without real economic basis and hence mere foolishness, or else talk for an ultimate purpose. Of course the general public is going to pay the rate advance.

We have heard it cited as an instance by a would-be sapient contributor to the papers that the increased cost of the freight on a pair of shoes from, say, Brockton, Mass., to San Francisco, would be much less than five cents a pair. But the writer is only begging the question, or rather thus virtually admits in the same breath that the public does pay, but puts the plea that the amount is so small, like unto the prisoner at the bar who swore he didn't steal the horse and if he did it was only a little colt anyway. And further, even on this point he generalizes from too few examples, which is a dangerous practice where correct conclusions are demanded. While it is not authoritative, we fancy the freight on a suit of clothes, a pair of shoes, and such other commodities like clothing are comparatively small. Of course, an advance, say of 25 per cent. is the same gross advance as a 25 per cent. advance on any other commodity, but, net, it would not be nearly so immediately obvious on the buyer's part as it would in the case of all bulk freights such as coal, iron, ore, grain, packing house products or lumber, which pay the big tonnage. And it is obviously the big or bulk tonnage, therefore, which will mostly "pay the freight," the increase. Because it is the big tonnage.

It is no news to lumber dealers that they will pay more. It has been rather with them a question of late if they should, if possible, stock up now, and

Barrett Specification Roofs

Bonded for 20 and 10 Years

City National Bank Building, Shreveport, La. Architects, Languinet & Statts, Fort Worth, Texas; Associate Architect, E. F. Neild, Shreveport, La.; Gen'l Cont., Central Contracting Co., Houston, Texas; Roofers, H. H. Bain Sheet Metal Works, Shreveport, La.

Scottish Rite Cathedral, Shreveport, La. Arch., E. F. Neild, Shreveport, La.; Gen'l Cont., Stewart-McGhee, Little Rock, Arkansas; Roofers, H. H. Bain Sheet Metal Works, Shreveport, La.

The Highland Sanitarium and Addition. Arch., C. W. King, Shreveport, La.; Gen'l Cont., Stewart-McGhee, Little Rock, Ark.; Roofers, H. H. Bain Sheet Metal Works, Shreveport, La.

Barrett Street School, Shreveport, La. Arch., Neild & Olshver, Shreveport, La.; Gen'l Cont., W. H. Werner, Shrevepport, La.; Roofers, J. W. Wilkinson, Shreveport, La.

Another "Specification" City—

AMERICA'S leading architects and construction engineers are practically unanimous in their endorsement of Barrett Specification Roofs. This is best proved by the fact that most of the permanent modern buildings all over the country have roofs of this type.

Take Shreveport, La., for instance—

This thriving city—the center of one of the richest sections of the South—is carrying forward an ambitious program of civic improvement and commercial expansion.

The soundness of the city's rapid development is attested by the substantial character of the new buildings, a few of which are shown on this page.

And nearly all the important buildings erected in Shreveport in recent years are covered with Barrett Specification Roofs.

The only Bonded Roof

Barrett Specification Roofs are the only roofs insured by a Surety Company Bond against upkeep and repair expense.

This Surety Bond runs for 20 or 10 years and is issued without cost to the owner. It may be obtained on any Barrett Specification Roof of 50 squares or larger in towns of 25,000 or more, *and in many smaller places where our inspection service is available.*

Our only stipulations are that The Barrett Specification *revised April 15, 1920,* shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection.

Important Notice

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof covering it is possible to construct, and while we bond it for twenty years only, we can name many roofs of this type that have been in service over forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof, bonded for 10 years. Both roofs are built of the same high-grade materials, the only difference being in the quantity used.

Full details regarding these Bonded Roofs and copies of The Barrett Specification sent free on request.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Cannot Burn

A sheet of pure gypsum rock, Sheetrock—the standard wall and ceiling material in unit form—is fireproof and resistive to heat, cold and sound. It cannot warp, shrink or buckle. It takes any decorative treatment, too: paper, paint, panels. Or you can use it in its own attractive finish of soft mist gray.

In any event—and whether for new construction or for alterations or repairs—you will find Sheetrock walls and ceilings beautiful, safe, durable and economical. And there is no trouble at all in putting Sheetrock in place. It can be sawed and nailed like lumber. Come and inspect a sample of Sheetrock today.

Architects will be ready for revised bids in two weeks.

Church (add.), Brooklyn, N. Y. Architects, Charles Bolton & Son, Witherspoon Building, Philadelphia. Owners, Reformed Church, Grove street and Anderok avenue, Brooklyn, N. Y. Stone. Preliminary sketches being drawn.

AS THE EDITOR SEES IT

(Continued from Page 764.)

thus for the present beat the advance, or wait and take a chance when the time comes, their course being largely influenced or determined for them on the point at the time by car scarcity and shipping possibilities, and such.

The order is in effect a virtual increase of about 33 per cent. on lumber freights. In dollars and cents it means not less than $6 added to the delivered cost of every thousand feet of lumber, a large advance in any circumstance and one which the industry cannot absorb. Whatever effect the increases may have on prices in general, it is certain that so far as lumber is concerned they mean higher prices to the public for all the lumber it buys.

And that is as sure as you live. Of course, some of the scoundrelly yellow journals will probably torture the statement in due time and jump to the conclusion that lumber is in for a 33 per cent. advance "by the Lumber Barons," or some such rot, which is something the words do not cannote. However, one can get inured even to misrepresentations of the yellows, much like the flea on David Harum's dog and his philosophy that a certain amount of fleas are good for a dog. They will keep the freight payer from brooding over the fact that he is the dog in the case. We fancy the same thing will substantially apply in all other lines, some naturally (such as the bulk commodities instanced), feeling it more for causes stated, but all commodities paying their share.

For many families seeking apartments and for corporations requiring increased office space to provide for business expansion, the co-operative plan of mortgage-free real estate ownership has helped solve the problem of soaring rents.

Present conditions in the mnoey market make it practically impossible to finance large building operations except on the co-operative plan. This method has worked out successfully in the building and ownership of numerous apartment house dwellings in New York City during the last twenty years.

Under the co-operative ownership plan, a group of occupants, owning stock in a corporation and occupying space in the

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

corporation's building, set aside a portion of the space for renting. The income from that part of the building not occupied by the stockholders is sufficient to afford a surplus over all operating expenses, insurance, and taxes.

When the corporation is organized, the stockholders purchase their space by paying a certain number of years' rent in advance. These payments defray the cost of construction of the building without dependence on the usual form of real estate mortgage. Figuring interest on his original investment at 6% and allowing 2% for amortization, the tenant owner will be able within approximately ten years to eliminate rent from the list of his annual fixed expenses. In addition to the saving in rent waste over a long period of years, the stockholder owns his office or his apartment, a tangible asset in itself.

The actuary of one of the large life insurance companies in New York has computed that a corporation purchasing under the co-operative plan office space renting for $50,000 a year—the purchase price being $350,000, the equivalent of seven years' rent—will be able to save $1,116,606 in twenty years. It is possible for this same corporation to amortize its investment of $350,000 in 9½ years and then save $766,066 in rent waste over the balance of a twenty year period.

As the first exmaple of the application of the co-operative ownership theory to the erection of a large office skyscraper, the plans for the Park-Madison Building in New York are being studied by real estate and building experts. This building with twin towers thirty-one stories high is to be erected over the New York Central railroad tracks just north of the Grand Central Terminal at a total estimated cost of $40,000,000. It will be one of the largest office buildings in the world.

A SEVENTEENTH CENTURY NEW ENGLAND FRAME HOUSE

One of the best preserved houses of the earlier Colonial Period in New England is the "Parson Capen House" in Topsfield, Mass., built in 1683 by the Rev. Joseph Capen and described in the latter bulletin of the Society for the Preservation of New England Antiquities. The house is now owned by the local historical society and was carefully restored in 1913 by its secretary. This house was well built, even for its day, and it possesses architectural embellishments unknown in other existing dwellings of that period. The second story widely overhangs the first in front, the garret floors project at either end and all are supported by ornamental wooden brackets. The overhang is a form of timber construction common in old English work and seems to have been done solely for its architectural effect. Beside the front door and under the gables are brackets that help to support the overhang.

The framework of these houses was usually of oak, though sometimes of pine and made of heavy timbers mortised and tenoned together and held in place by wooden pins. Their joints were hewn with much skill by men who worked as their medieval forefathers had done. The foundation timbers rested on an underpinning of field stones, laid without motar.

The timbers of the framing in the Parson Capen House are of course very old, and the original newel and turned balusters of oak are still in place. Much of the interior woodwork, however, and all of the shingles and clapboards are restored. This restoration serves to show how the houses of the early period looked when fresh from the hands of the builders. Under the northern ends of the "summer beams"—which is one of the curious features in the Parson Capen House—being girts spanning the rooms, is incised with a chisel the date, July ye 8th, 1683, so that the exact date when the "frame" was raised is known.

NEW YORK HOUSING CONDITIONS

Only such construction as will relieve the shortage of dwelling accommodations and such construction as in the public interest, should be given building permits, says Mayor Hylan of New York City, urging that legislation be enacted authorizing some responsible body to pass on permits for construction. The Mayor's report on local housing conditions show that at least 100,000 additional apartments are urgently needed to provide homes for the city's population. A total of 12,662 apartments and houses are now under construction but to meet the abnormal demand a sufficient number of tenement houses must be erected each year to provide at least 50,000 apartments. Under the state constitution New York City has no power to construct municipal apartment houses and rent them to private parties, but an amendment to the constitution can be passed and the city could then go ahead with its building program in January 1922. In the meantime, the Mayor says, there should be no standstill in the erection of homes and multi-family houses.

PEP PARAGRAPHS

A fool is one who doesn't know what he knows.

Cold feet and hot heads frequently travel together.

Pep is the salt of business; lack of faith is the bitters.

Knocking gains nothing; boosting gets respect, if nothing else.

Don't run away from the truth; meet it squarely and overcome it.

Worry never injured a fly, but a swat of the hand will kill the pest.

If you're looking for a lonely man, find one who hasn't enough to do.

Enthusiasm will blaze the way for any deal you want to put through.

If you want to land a certain job, know more about it than anyone else.

Co-operation is a fine thing, but learn to run under your own motive power.

Don't let personal feeling enter business; stick strictly to the merits of the proposition.

Fish may be caught with a hook and line, but it takes real brains and persistence to land an order.

(Copyright, 1920, by S. A. Chandler.)

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

As The Editor Sees It

ECONOMY IN SCHOOLHOUSE PLANNING AND COSTRUCTION

BY W. R. MCCORNACK, ARCHITECT, BOARD OF EDUCATION, CLEVELAND, OHIO

This paper will treat with principles rather than details for the reason that mis-application of principles is generally the cause of great mistakes.

A prominent state official recently made public a statement that millions of dollars are being wasted in the State of Ohio in costly facades to school buildings. Unfortunately, this reflects an erroneous but often popular opinion, the facts being that in the most ornate public school buildings all the stone work, including base courses, steps, window sills, belt courses, copings and ornamental work does not exceed 4% of the total cost of the building and the ornamental stone work not more than 1%. For the aesthetic welfare of any community this small expenditure can and should be defended.

It is not elaborate facades but wasteful planning that costs money.

What are the causes of this waste?

The greatest cause is inadequate architural service, which must inevitably result in wasteful plans and inferior buildings.

In Ruskin's "Seven Lamps of Architecture" we read:

"Architecture is the art which so disposes and adorns the edifices raised by man, for whatsoever uses, that the sight of them may contribute to his mental health, power and pleasure."

It is a fact that there is a greater percentage of poorly designed and poorly built schools in this country than any other type of building, except some of the very cheapest commercial forms.

It is also a fact that only a very small percentage of the architect who have attained a commanding position in the profession due to careful training and ex-

Why is this true?

It is true too often because school authorities listen to architects who present their cases on the basis of cheap commissions, and because they claim they can build school buildings for less money than their competitors, and also because the architects and educator fail to co-operate.

Wheni the knowledge becomes common that a school is to be erected in a community not only are well qualified architects considered but less qualified of the profession present their cases, the latter agreeing to do the work for 3 or 4%, when it is a well known fact that no architect can provide thorough study and good service for any such price, yet many of the school authorities will be taken in by this argument.

Any architect who agrees to do work for less than the recognized rate of compensation and who guarantees to build for a certain price or forego his commission, is ignorant of the service he should render his client or he is dishonest, or he is both. How can an architect guarantee a price when he has no drawings before him, when contractors estimating from completed drawings vary so much in their estimates?

You buy clothing or any other material and expect to pay the merchant 15% or 20% or 25% profit. Without question you allow the contractor 10% or 15% profit with his overhead, but the architect is supposed to provide more service and assume more responsibility than the contractor, and the architect's smaller fee must include his overhead and what profit he can make and generally the low commission architect slights his work to squeeze out his profit.

Not until we appreciate architectural service on a higher plan with higher fees and make the architect financially responsible for all the errors in his plans, will school authorities secure service which means the elimination of waste in schools, better buildings which means less maintenance cost in the future, and structures of such architectural quality, that they should be an asset to the community.

Why not build something at the same price, charming and delightful, showing appreciation of architectural precedent and an intelligent use of materials, good proportions and forms, a credit to the

BLUE PRINTS

architect, School Board and community?

The appearance of any building may be enhanced by small outlays of money in landscape gardening, yet how little is done, when all that is mean and sordid about any building or site can be so easily eliminated at so small a cost.

We talk more of standards and standardization than we do of the great broad problem of planning and construction. Standardization is an excellent thing, but it can lead us into dangerous by-paths.

In the Cleveland school system for years a certain desk was standardized. This desk required a room 25 feet wide and 32 feet long to seat 42 desks of a given size. By redesigning the furniture it was found possible to place the same number of desk in a room 24 feet wide and 28 feet long, thus bringing about a saving of 3000 cubic feet per room, which at a per cubic foot cost 20 cents, means a saving of $600.00 per room or more than double the cost of the furniture. In a thirty-room building this means a saving of $18,000.00. This amount at compound interest for 50 years, or the life of the building, amounts to $20,000.00 per room or $600,000.00 for a 30 room building —enough to pay for the building.

What seems to be very minor matters in planning are full of danger and financial calamity to groups of school authorities continuing to pursue a polcy of careless planning, and indicts any architect or school man continuing to disregard the study of the problem of saving space. On the other hand, this reduction in class room area does not show to advantage when comparing class room areas with corridor areas, and we must be alive to these facts in our studies of standardization and consecrative areas.

But there is a much more serious problem in the matter of waste space which has gone unchallenged for decades. It has caused such an alarming waste of money in this country that remedies must be found without further delay before millions of dollars more are thrown away.

This has to do with waste due to stairs, and corridors. There are 1,250,000 sq. ft. of floor space in the school buildings of Cleveland devoted to stairs and corridors. This is an area equivalent to 1560 class rooms or enough to accomodate 62,-400 children, and at the present cost of building in the City of Cleveland it would require $35,000,000 to construct this number of rooms.

Considering that Cleveland is equal to one hunderth and twentieth of the population of the country, the space devoted to stairs and corridors in the entire country is equal to 187,200 class rooms, or a seating capacity for 7,480,000 children, and the replacement cost would be $3,-744,000,000.00.

We must, however, admit that a certain amount of unusuable space is necessary in any type of building.

Cleveland has been studying the question of elimination of waste space with the result that three types of plans have been developed.

These types are:

First—One story corridorless elementary school—10% of the floor area in corridors.

Second—Three story corridorless elementary school—12% of the floor area in stairs and corridors.

Thrd—Junior High School combination one and three story building—15% of the floor area in stairs and corridors.

Assuming that 15% is the average amount of waste space in these new types of plans, there is a difference of 10% between the average waste space in the Clevelaind school today and the waste space in the proposed new types.

Therefore, 40% of the 1,250,000 sq. ft. of stairs and corridors in the buildings of our present system has been criminally wasted.

This is equivalent to 625 class rooms, representing seating accomodations for 25,000 children and these 625 class rooms at the present cost of construction in Cleveland would require $15,000,000.00 to replace. These 625 class rooms seating 25,000 children represent the actual shortage in Cleveland today.

Using the ratio of population of Cleveland to that of the nation mentioned above, the unnecessary waste in the entire country amounts to 75,000 class rooms or seating space for 3,000,000 children, and the replacement cost is $1,500,000,-000.00.

While I believe the figures I have quoted are fair, yet for the sake of making the comparison fairer on account of lower building costs in some section and possibly less waste in others, let us arbitrarly reduce the waste by 33-1/3% with the result that space equivalent to a seating capacity for 2,000,000 children at a replacement value of $1,000,000,000. has been wasted in the schools, in this country, while cheaper school buildings have been made necessary, while the children have been denied the refinements in equipment which they should have and the community buildings of the highest architectural and structural standards. Such architecture produces structures whose cheapness results in a tremendous overhead cost of maintenance, and these results have been brought about by architects who have not thought of buildings as having a financial return on the investment.

This deplorable situation exists because a school building has never shown nor is it probably possible to have it show a financial return on the investment.

Hotels and office buildings require a large amount of stairs, corridors and lobbies, because of the small units each of which must be reached independently, yet no hotel or office building properly planned shows more than 15% in waste space, and mercantile establishments and factories almost nothing. No architect could survive who planned buildings of this type which require a definite fin-

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Barrett Everlastic Roofings

Roofs to be proud of—

YOU never have to make excuses for an Everlastic Roof. It satisfied the owner when it is new and it continues to satisfy him through many years of service.

Everlastic Roofings are made in both shingles and roll form—two styles of each. And three of the four styles are surfaced with real crushed slate, in permanent natural art-tones of red or green.

This means that you can use Everlastic on *any* steep-roofed building and so *be sure* of a moderate priced roof that will please the owner and be a mighty good advertisement for you. Look for the Everlastic Label. It is your protection against inferior roofings.

Barrett Everlastic Roofings are carried by enterprising dealers everywhere.

Illustrated booklet giving full information, will be sent free upon request

Everlastic Multi-Shingles.

The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Single Shingles.

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8 x 12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing.

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing.

This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Cannot Warp

U.S.G. SHEETROCK

Makes Rigid, Warp-Proof Walls

A sheet of pure gypsum rock, encased in a heavy protective covering—tough, rigid and durable—Sheetrock cannot warp, shrink or buckle. This standard wall and ceiling material in unit form is fireproof too. Uniformly and permanently even in surface, it takes any decorative treatment: paper, paint, panels. It resists heat, cold and sound.

And Sheetrock is put up quickly, economically. Made by the special U. S. G. process, it can be sawed and nailed—as readily as lumber. The nailing strength is reinforced by the U. S. G. Patented Reinforcement.

If you are thinking about building a new home, or perhaps just a play room for the children, a spare bed room, an attic room, a laundry, a clothes closet, or a sleeping porch, it will pay you to learn more about Sheetrock. We will gladly provide you with complete information.

(Continued from Page 780.)

ancial return on the investment who would plan a building with the excessive amount of waste space existing in our schools. In addition add to the corridor and stair waste, all the basements, oversized rooms, schools used during a small portion of the year, and we have a condition of waste of school funds so stupendous as to be almost beyond belief.

Three types of school plans are presented for your consideration, which are offered as a possible solution of some of the evils which have been mentioned.

These plans are as follows:

Slide 1—One story corridorless elementary school having large play courts with the auditorium separated by double movable partitions thoroughly soundproofed—power plant outside of building—cast iron smokeless oil burning boilers.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

All class rooms with separate outside exits. Safe, economical and architectural.

Slide 2—Three story corridorless elementary school—double play courts—unit system of plan-unit system of stairs—power plant outside of building.

Slide 3—Combination one and three story Junior High School plan—three story front section of class rooms extendable—Auditorium and gymnasium in the center surrounded by one story shop section also extendable.

These plans are a further advance over the ones shown last year, and we believe that they are merely pointing a way toward a broader and more comprehensive study of school buildings which shall be more elastic and less wasteful. Let us strive for better architectural service which has been the actual cause of this terrible waste, and it is the chief medium through which better conditions can come.

It is time for all school architects and school men to stop and at once inaugurate a policy of intensive study of the school building problem; to reduce its cost without injuring its beauty and its usefulness or construction value, and I believe this study should be concerted and nation wide, and that a National Bureau for such study is not too visionary a proposal to be idly passed by.

In conclusion, let me quote the words of Ruskin, who has stated more clearly than any one I have ever read, a great truth.

"All work of quality must bear a price in proportion to the skill, time, expense and risk attending their invention and manufacture. Those things called dear, are, when justly estmated, the cheapest. A composition for cheapness and not for excellence of workmanship is the most frequent and certain cause of the rapid decay and entire destruction of arts and manufacture."

"SKILL, INTEGRITY, RESPONSIBILITY"

Classification of Contractors by Standard Ratings Proposed to Stimulate Efficiency

BY LEONARD C. WASON, ABERTHAW CONSTRUCTION COMPANY, BOSTON.

MAKING preparations for things that do not happen usually implies waste—sometimes waste of energy, sometimes waste of both energy and money.

Maintaining an organization to attract business only a fraction of which is eventually secured is a necessary process, yet it contains elements of waste. Ordinarily this waste is not considered serious if it bears sufficiently low ratio to actual scales. But, as the ratio increases, there must come a time when selling costs will constitute an intolerable burden of overhead expense.

Without carrying this part of the discussion further, it will probably be admitted that, if that part of selling—or business-getting—which consists of barking up empty trees, could be eliminated, or materially reduced, much waste would be avoided.

These considerations hold particularly in the case of construction enterprises. He would be rash who would atempt to guess the amount of fruitless expenditure on the part of contractors in the preparation of estimates and proposals for work—especially public undertakings, that is never awarded them. Their only means of gaining consideration is to go through the formula, knowing all the time that the engineer in charge always may rule out a favorable proposal on the ground that the contractor making it is probably incapable of meeting all the obligations entailed in his offering.

AVOIDING WASTE THROUGH CLASSIFICATION

Under existing circumstances the right to reject any proposal must, of course, reside with the engineer in charge. Yet waste would be avoided by restricting the competition in advance to contractors who can render satisfactory proof of capability for the type and magnitude of the work to be undertaken. Such capability should be immediately determinable in accordance with a system of marks or ratings which a board of engineers and contractors could, without much difficulty, devise.

Given a task of known magnitude, it is a simple matter to compute the amount of liquid capital which a contractor must eventually command in order safely to assume the operation. By the same sign, when the nature of a large work is clearly understood, it is foolish to consider—even in theory—placing it in the hands of a contractor who is unable to supply adequate proof of special experience on his own part and on that of the supervisors in his employ.

The item of "plant"—equipment—is of constantly increasing moment. What kind of plant, and in what quantity, does the projected development require? Does the competing contractor own this equipment? If so, in what condition has he maintained it? If not, how and where does he purpose to get it, and what assurance has he that he will not be disappointed?

INSURING THE EXISTENCE OF THE ESSENTIALS .

Eliminate any one of the factors, capital, experience, equipment, and the multiple—satisfactory accomplishment—can never be obtained. That is virtually self-evident. The advisability of insuring the existence of the factors before talking of setting them into operation seems equally clear. If the suggested

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

system of marks, or ratings, were in active existence the engineer in charge of the work on which proposals were to be invited would announce at the outset the limits of ratings within which the proposals of competing firms or individuals would receive consideration.

Such a definition of terms would rid the competition of the purely speculative and irresponsible bidder, as well as of the honest but over-optimistic seeker after business. In so doing it would relieve the engineer of the grave responsibility of rejecting certain bids solely on the basis of his judgment, or of general report. It would have the further advantage of bringing the bidding contractor to a clearly understood common denomination of ability and intention that would make comparisons of their proposals a simple one. In a larger proportion of cases than under existing methods, the award would go to the one making the most attractive offer.

If we ever reach the point of specifying the qualifications of contractors instead of stopping at the specification of materials and processes, we may, perhaps, hope to see adopted the device of making payments to contractors to cover the cost—often extremely heavy—of preparing their estimates. It is a cost that must be met by someone,—in the first instance the contractor. But he, in due course, dilutes it through the profits of the jobs that he obtains, thereby making them pay toll to the jobs that he loses.

A METHOD OF GUARANTEEING SKILL, INTEGRITY, AND RESPONSIBILITY

Here then is waste:—waste much of which is avoidable by the comparatively easy and completely honest process of rating contractors according to proved qualifications. Nothing invidious is implied in this process, nor is there anything in it to prevent the contractor from securing added recognition as it is due. It would, indeed, stimulate effort by recording growth through various stages, each carrying its virtual guarantee of capability. Hence, in accomplishing an economic good, it would, in addition, achieve the ethical good of raising the whole tone of the contracting business from that of a too often uncertain trade to that of an honorable profession.

—The Bulletin.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

PLAY SAFE ON COST QUOTATIONS

THE day is past when snap judgment cost quotation is either safe or sensible. In the pleasant days before the war when we were all more or less educated to the standard of building material and labor cost, it was easy enough to answer the usual question of a client who wanted a job done. The procedure then was for the client to show the plans of a house, probably one he had clipped from some publication, and say, "Bill, how much do you think you can build this house for?" and you would say, "Well, John, I think we can get away with it for about $7,000." And you would probably be right, particularly if you had figured roughly on the cubic foot basis.

Today, when he asks you the same question, a habit which the prospective home-builder has outgrown, you are quite likely to tell him $10,000 and the job will cost $12,000 or $13,000. Or possibly, being of a "safety first" nature, you will tell him $14,000, when it will cost only $11,000 or $12,000. You are particularly likely to do this if you have just been stung on a contract. What is the result? He goes to another builder, who tells him $11,000, and in the usual manner of the prospective builder, he is impressed by the lower cost, and feels that the man who quoted that cost to him knows more than you do. On the other hand, if you quoted him a snap cost of $11,000 and when he gives you working drawings and tells you to figure, it runs $14,000 he still thinks you don't know your business.

Costs today are certainly difficult to keep up with, and the only safe way to figure on a cubic foot basis is to take the experience of last month and add about 20%.

From the advice of many builders who are successfully getting work today, it would seem that it is much better to lay the cards on the table and tell the prospective client that you can not give him the cost without the careful study of the plans.

COST-PLUS BUILDING

In many instances today, building contractors are doing work on a service basis rather than a guaranteed cost contract. In cases of this type the owner places great confidence in the builder, and pays him for his expert service in carrying out the work a commission amounting usually to 10% of the cost of labor and material. This is of course an ideal arrangement from the builder's viewpoint and one which should not be overlooked if a service of this nature is to be built up.

Quoting cost under this type of contract is an exceedingly delicate matter. Very careful estimates should be made before any figure is given to the owner, and for contingencies 10 or 15% should be added to the estimated cost to care for various unexpected costs which may arise. The builder will certainly add greatly to his reputation if he builds a cost-plus contract within the cost quoted to the owner. On the other hand, his reputation is considerably damaged if he has to call for considerably more money before the job is finished.

—Builder's Journal.

PEP PARAGRAPHS

Pomposity is ability only when seen on the comic stage.

An advertiser is one who has faith in what he has to offer.

The largest rewards go to those who take the greatest risks.

Wisdom is the result of experience, observation and thought.

An ounce of honest criticism is worth more than a ton of flattery.

A man with something of his own has a fair chance of using that of another.

The coldest feet can be cured with a little success mixed with self-confidence.

Our life tomorrow is what we plan today, if we but persevere and do what we say.

More than one private stenog is a living file of all her boss' matrimonial troubles.

Those quickly offended by the blunders of others are slow to admit the blunders of themselves.

Some folks think that a high-brow is one who sticks up his nose. And sometimes we think they are right.

Some employees spend so much time watching the clock that they have to stay after hours to finish their work.

(Copyright, 1920, by S. A. Chandler.)

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

As The Editor Sees It

FRED J. HARTMAN, Secretary, Industrial Board Department of Labor and Industry of Pennsylvania, has sent a letter to Architects and Builders of Pennsylvania asking their co-operation in behalf of a Building Code for Pennsylvania.

A commission designated as the State Building Code Commission spent several years in earnest study and faithful work in attempting to formulate a building code for Pennsylvania. For various reasons it was not adopted by the Legislature. That there is a need for more adequate building regulations in Pennsylvania becomes more apparent each day. As a step towards securing such a code a meeting will be held in Harrisburg on or about October 15, 1920, to talk over the entire situation.

The bill as presented had incorporated within it a provision, to the effect, that separate codes for the several classes of buildings be worked out as standards of the Industrial Board of the Department of Labor and Industry—a provision which perhaps could be developed at this particular time. At the meeting there will be discussions of the advisability of the Industrial Board drafting a code, using as a basis the data already gathered, with the aid of a representative committee of persons interested in the building construction industry.

* * * * * * *

In view of the importance at this period in the development of our country of bringing together every factor in the building and construction field, including especially the employing and working elements, it is felt that the establishment of an organizing committee to convene the newly organized National Congress, somewhat along the lines of the Parliament of the Building Trades in England, is worthy of serious consideration.

The Special Committee appointed at a meeting of the National Building and Construction Congress held in Atlantic City, August 6th, announces the appointment of the Organizing Committee. Among the appointees are three prominent Philadelphians: D. Knickerbacker Boyd, Architect and Structural Standardist, Estey Building; Ernest T. Trigg, President, National Federation of Construction Industries, Drexel Building; and Col. J. R. Wiggins, General Contractor, c/o John R. Wiggins, Inc., Otis Building.

At the meeting, representatives of many elements of the building and construction Industry discussed the advisability of founding a congress for the promotion of the industry by harmonizing existing differences of opinion or establishing new methods of procedure. The action taking at the meeting is embodied in the following preamble and resolution, which was adopted:

WHEREAS, The history of all civilization links periods of prosperity with those of great building and construction activity, and

WHEREAS, the building and construction industry is now facing difficulties which are seriously retarding national progress, and

WHEREAS, this condition is not for the best public interest because of unemployment, congested habitation and insufficient facilities, and

WHEREAS, it is believed that the solution of problems locally or from the standpoint of any single element, without the concurrence of counsel of the other elements, cannot remedy the chaotic conditions now existant.

Now, therefore, be it

RESOLVED, (a) That a thorough study be made of the relations of the various elements and industries, which enter into building and construction activities.

(b) That a committee of representatives of the interested elements meet at Chicago on September 27th, 1920, to convene a congress to provide the ways and means of conducting such a study to the end that the various factors which have retarded necessary building and construction may be eliminated; and

(c) That a building and construction congress be permanently established to give continuity to the nationally beneficial objects which gave it birth.

SENATE COMMITTEE IS GETTING DOWN TO BUSINESS

Senator Calder Appeals to Shipping Board to Help Relieve Transportation Congestion in the East—Committee Is Studying Availability of Finance for Construction—Tax Exemption Under Certain Conditions is Suggested —Co-operation is Solicited

THE Senate Committee on Reconstruction and Production, appointed pursuant to Senate Resolution No. 350 to inquire into the general building situation throughout the country and report to the Senate on or before December 1, 1920 measures necessary to restore the construction industry to normal activity, has completed its preliminary work of organization.

It is the purpose of the committee to take under advisement and consideration all the factors contributing to the present shortage of housing and industrial construction. It was reported to Senator Calder, chairman of the committee, that there were six thousand freight cars loaded with coal in the vicinity of Norfolk and Newport News, Va., waiting for export. As the most difficult problem confronting the construction interests today is the shortage of transportation, Senator Calder sent the following telegram, addressed to Captain Paul Foley, Director of Operations of the U. S. Shipping Board:

"I am advised that there are several thousand cars of coal in the vicinity of Newport News and Norfolk. Am I correctly informed that there is now in effect a partial embargo on the exportation of coal or a preference for domestic consumption? If so, would it not afford material relief in the present critical fuel situation if the Shipping Board were to assign several tugs and a number of barges for the transportation of this coal to New England? The suggestion is made to me that five tugs and thirty barges would be helpful for this purpose. The shipment of this fuel by water would also release several thousand cars for the transportation of other necessaries, particularly of building materials urgently needed in construction under way for the relief of the present critical housing situation throughout the country. If the facts are as stated, it would seem that the Shipping Board might offer real assistance in this connection and I hope that early consideration might be given to the matter."

Commission Grants Hearing to Industry

At the request of Senator Calder, the Interstate Commerce Commission has granted hearings to representatives of the building industry in order that they might present to the Commission the inevitable results of a continuance in operation of the recent car service orders which amount to an embargo on the transportation of building materials. In New York City for example, where building, in order to afford relief to the housing shortage during the coming winer, must be started during the next three months, activity in the building line is seriously hampered on account of the uncertainties of transportation. Hon. Frank Mann, Tenement House Commissioner of New York City, has appeared before the I. C. C. and given them facts as to the critical and almost desperate situation in which New York City now finds itself in getting building materals to erect homes to house its growing population.

Suggests Tax Exemptions Under Certain Conditions

The Senate Committee on Reconstruction is also giving consideration to the lack of adequate financial facilities for the construction industry. It is aware of the fact that on account of the high rates of interest prevailing, the builder is now unable to bid against the speculator in the money market. Senator Calder has stated that a valuable suggestion has been offered to the committee in a provision of the new shipping law. Senator Calder, who aided in framing this legislation, said that under the new law, all profits in the operation of American ships in the foreign trade are exempt from federal taxation, provided the profits are invested in the building of new ships in American shipyards, and provided the owners put $2 of new money into new ships for every $1 of exempted taxation.

Senator Calder is of the opinion that this feature of the shipping act might be applied to new building construction and that profits from construction might be exempted from federal taxation if the money is invested in new construction and the builder puts twice as much money into such new construction as the amount exempted from taxation. This phase of the matter is under consideration by the committee and the practicability of the provision of the Shipping Act being applied to construction of homes, will be determined later.

Co-Operation is Invited

The Senate Committee on Reconstruction earnestly invites the co-operation of all public bodies which have housing matters under consideration, and it will also be glad to receive communications from individuals or concerns who wish to present information or suggestions which will be of assistance to the Committee in its investigation.

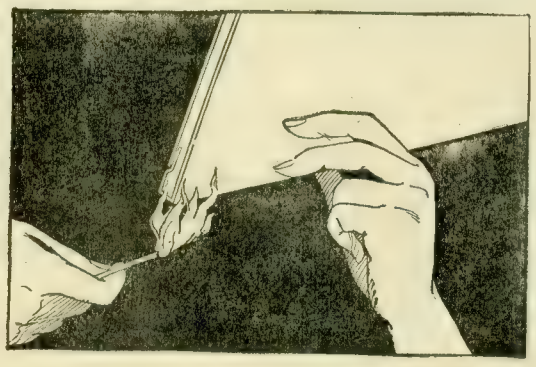
It Is Lasting



Sheetrock is a sheet of pure gypsum rock, sheathed in a heavy protective covering. It is the standard wall and ceiling material in unit form—for new construction, alterations and repairs.

Manufactured by the special U. S. G. process and uniformly even in surface, it takes any decorative treatment: paper, paint, panels. Or it may be used in its own attractive finish of soft mist gray.

Sheetrock is fireproof too, and it cannot warp, shrink or buckle. It resists heat, cold and sound, insuring maximum insulation the year 'round.

Beautiful walls and ceilings, safe walls and ceilings, walls and ceilings that insure lasting comfort and economy—that is what Sheetrock means. Come in and inspect Sheetrock yourself, and you will see why we personally endorse its use.

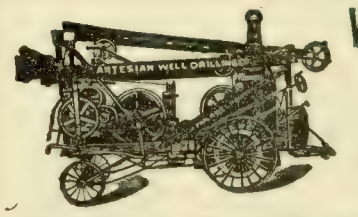
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

C., in accordance with the specifications and drawings mentioned therein, copies of which may be had at this office or at the office of the Custodian, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., Sept. 7, 1920. Sealed Proposals will be opened in this office at 3 P. M., Sept. 30, 1920, for the installation complete of an electric freight elevator in the United States Post Office at Wilmington, N. C., in accordance with the drawing and specification, copies of which may be had at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

LABOR'S RESPONSIBILITY for construction costs recently came in for investigation by the grand jury in Cuyahoga County, Ohio. The grand jury probed into construction conditions in Cleveland and, according to *Building Industry,* a magazine devoted to construction matters in the state of Ohio, the grand jury report contained the following statements:

"We would be remiss in our duty did we not point to a lamentable condition which no doubt has injured the very group which created it as much, if not more so, than the public generally. We refer to the present tendency upon the part of mechanics, artisans and laborers of all trades to do less than a full day's work. The testimony adduced before us indicates conclusively that it requires approximately twice as long with the same number of men to erect a house to-day as it did in pre-war times. Impartial tests show that it takes twice as many carpenter hours to do the carpenter work on a building as it did in pre-war times. Bricklayers lay less than half the work in the same time that they did five years ago. Manufacturing firms which make and sell building materials prove by their records that, while wages have gone up two hundred per cent in some instances, labor cost have gone up four hundred per cent, indicating that their employes are getting double pay for one-half the work, as compared with the period before the war."

Building Industry in commenting on the findings of the jury, says that prior to its report the Cleveland Builders' Exchange had made an investigation and developed a similiar conclusion. It states, also, that officials of the Building Trades Council in Cleveland protest that the statement is an exaggeration of the facts, contending that building trades labor has decreased no more than 5 per cent in efficiency.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

MODERN TRANSFORMATIOINS—ARCHITECTURAL POSSIBILITIES IN ARTISTIC OLD HOUSE

There was never a time when the services, tastes and special knowledge of the trained architect were more needed or more in demand. The carpenter and builder have for years been consulting experts in the building of thousands of suburban homes and farmhouses, and let us give them credit, at least, before the jigsaw era, for many beautiful and charming old houses, says a writer in the Architecture, who continues:

"Following the building shortage in these later years has come an appreciation of the fact that any old house, or new, be it as hopelessly ugly as it may, has possibilities. Architecture has shown many instances of 'before and after,' of old ramshackle, barn-like structures, altered into most delightful homes. Old barns have been made over into charming studios and living quarters, woodsheds incorporated into the redesigning of an old farmhouse. Everywhere is shown a wider appreciation that nothing is impossible to the architects of taste and skill.

"The old and hopelessly ugly city brownstone house and the little two or three-story brick house or stable on a side street have been made into artistic and attractive apartments or studio buildings.

"It is to the architects that we owe this renaissance and we have only made a beginning toward the development of the city beautiful from old and unsightly and out-of-date structures. Lest some should say that we are dealing with merely idealistic matters, with our own desire for better things artisically we remark that in every instance these 'artistic' improvements have proved the very best of business in increased rents and more desirable tenants.

"If the cost of new buildings has deterred many from carrying out their long cherished dream of owning their own home, there is abundant opportunity almost everywhere for the alteration of old places at very moderate cost. And old houses nearly always offer the nucles of a more substantial structure than many hurriedly-built modern houses put up in quantities for speculative purpose.

"In considering a new house the architect can very often effect a large saving by taking full advantage of local materials. The familiar stone houses of Pennsylvania are greatly admired, and throughout the New England States there are abundant reasons for using the local stone. It is right at hand and the transportation cost is a minimum one. An instance of the effective use of local stone came to mind some time ago in the purchase from an old Connecticut farm of the moss-covered stone fences that for generations had testified to the hard labor of the first owners of the field they inclosed. They added a picturesque and inexpensive note to a big fireplace and outside chimney.

HOW TO ESTIMATE

BY I. P. HICKS

In estimating material for interior finish it is quite an advantage to go over the plans and take down some of the necessary data from which to make the estimate something after the following form. This gives you the data in a convenient form and saves the time of looking over the plans an extra time for each different item in the estimate.

Rooms	Size Feet	Feet Base.
Vestibule	4x 6	20
Living room	14x18	64
Dining Room	12x16	56
Kitchen	10x14	48
Pantry	6x 7	26
Rear Entry	6x 6	24
Stair Hall	8x12	40
Second Story—		
Bedroom	12x14	52
Bedroom	13x16	58
Bedroom	12x15	54
Bath Room	8x 8	32
Closet	4x 4	16
Closet	4x 5	18
Closet	3x 5	16
Stairway	4x10	22
Hallway	5x16	42
Total	....	594

In the above estimate the plastering has been figured for a 9-foot ceiling for the first story and for an 8-foot ceiling for the second story. Small fractional parts of a yard have been discarded.

Note that the actual size of the rooms have been figured and in the matter of base it is safe to deduct 2½ feet for each outside doorway and 5 feet for each inside doorway. With the picture molding it is different. On this there is nothing to take out and a few feet should be added to make up for the waste in cutting, say about 5 per cent.

Beam ceiling should be carefully figured according to the way indicated on the plans, and enough should be added to each length to cut on. Room cornice should be figured in like manner. With the plate rail the doorways are figured out, but do not figure too close for there is sure to be some waste in cutting plate rails.

It will be found that this form of estimating saves some time and tends to accuracy as well. Rooms that have no picture mold, beam ceiling, room cornice and the like, such parts are left blank in the form, but all rooms have base and pastering, and in this way you catch the many items you must figure on in just once going over the plans.

From the yards of plastering you can estimate the lath required. Four-foot lath require 15 lath per yard 32 inch lath will require 22½ lath per yard. If you want to use some of both lengths of lath divide the yards something like this, ¼ of 734 yards would be 183 which you would multiply by 22½ to get the short lath required. You would then have left 551 yards on which to figure the 4-foot lath,

Feet Picture Mold.	Feet Beam Ceil.	Feet Room Cor.	Feet Plate Rail.	Yards Plaster
...	...	...	...	23
64	128	...	...	92
56	...	...	56	77
...	...	...	...	64
...	...	...	...	31
...	...	...	...	28
...	...	...	...	51
...	...	40	...	
52	...	...	...	65
58	...	...	...	74
54	...	...	...	68
...	...	...	...	36
...	...	...	...	16
...	...	...	...	18
...	...	...	...	16
...	...	...	...	29
...	...	...	...	46
284	128	40	56	734

thus you would multiply 551 by 15 for the long lath. This makes the figuring very easy for using the mixed lengths of lath and as some lath have to be cut any way it is all O K to have some of the 32-inch lath, but do not figure too many of the short lath for where 4-foot lath can be used without cutting they work to a better advantage than the short lath.

From the yards of plastering you can also estimate the sand, hard wall plaster and lime for the white coat.

There has always been a demand for some short cut in estimating carpenter labor, but the unreliable methods of these short cut ways of estimating have always been a serious drawback to the short cut work.

We will give a system which we think the average contractor can work out to meet his own needs. Don't take it for

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

granted that our prices are exactly right but use the system and make your own prices. It has been our aim to make the prices average up approximately $1.00 per hour. It is quite likely that the contractor would make good at the prices given. It is the method and system that we want to set forth more than the prices. By keeping a cost record of work by this system the contractor should in a short time be able to perfect his prices so that he could make this plan of estimating as a complete success. We do not offer it as an extremely short cut in estimating but as a method of shortening the work to quite a considerable extent and without any hazardous risk to the contractor. The short cuts in estimating that are so short that they result in just a mere guess are not the kind to benefit by, they are more than likely to prove your financial ruin than a benefit, so do not trifle with them.

The way to go after an estimate by our method is like this:

Framing floors, including rough floors, 18 squares, $6	$108.00
Laying finish floor, oak, 10 squares, $6	60.00
Laying finish floor, pine, 8 squares $5	40.00
Framing partitions, 16 squares, $3	48.00
Framing ceilings, 8 squares, $1.50	12.00
Framing porch floors, 3 squares, $3	9.00
Framing porch ceiling, 3 squares, $1.50	4.50
Outside walls, framing and sheathing, 24 squares, $5	120.00
Putting on stucco boards, 24 squares, $1	24.00
If ½x4-inch siding is used, figure per square, $4.	
If shingles are used on outside walls, figure per square, $6.	
Roofs, framing sheathing and shingles, 20 squares, $10	200.00
Main cornice, 160 lineal feet, 25c	40.00
Porch cornice, 120 lineal feet, 3c	36.00
Porch steps, 20 lineal feet,30c	6.00
Porch rail, 110 lineal feet, 20c	22.00
Inside base, 600 lineal feet, 10c	60.00
Picture mold, 360 lineal feet, 3c	10.80
One sidelight doorway	14.00
One grade entrance doorway	10.00
One rear entrance doorway	9.00
One set folding doors	14.00
Main door opening, 18, $8	144.00
Window openings—	
2 mullion frames, 4 windows, each, $18	72.00
2 triple frames, $14	28.00
4 twin frames, $9	36.00
7 single frames, $5	35.00
6 cellar frames, $1.50	9.00
Main stairs, 16 steps, $250	40.00
Cellar stairs, 11 steps, $1	11.00
Pantry cases, etc., $3; each door, $2.00; each drawer, shelving per lineal foot, 10c.	
Hook strips and shelf, ordinary closets, each closet, $2.	
Mantel shelf	12.00

We have now shown the system, keep cost records by this method and make your prices to suit the work you have. Extend the system by adding new items as they suggest themselves to you in your business and you will soon have something worth all the little time it will take you to attend it. Shorten the work where you see a chance to do it with a safety but do not sacrifice safety for shortness.

—*The National Builder.*

A UNIQUE BUNGALOW

THE home maker who is interested in the unusual or the builder whose customers want "something different" will be interested in a little house of a type highly popular in California. The climate of the Eastern States does not permit the free use of the Spanish Mission type, but very sensible, and surely good to look at, is a house which has been built for New York's "Own Your Own Home Exposition."

With its six rooms and bath it would make a very comfortable home anywhere. A very large living room with a big fireplace in the heart and center of the home and grouped about it are the other rooms, the two bedrooms having a bathroom between them. The materials used are just those which would be used if the house were built in California—tiles for the roof and stucco for the walls, a terrace paved with brick and the entire structure resting on a brick foundation. The house is so compact and economically planned that a good builder could put it up without its cost running to a prohibitive figure.

"Advertising is much like running a furnace. You've got to keep on shoveling coal. Once you stop stoking, the fire goes out. It is strange that some people's imagination can't compass this fact."

"Nothing great was ever achieved without enthusiam."—Wm. Wrigley.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

PEP PARAGRAPHS

Success is not as you find it, but as you make it.

When stagefright enters the brain, orders fly out of the window.

The early bird catches the worm; the late employee gets the squirm.

Age is nothing but decay. A man may be old at 20 or young at 70.

Putting the G in genius. You start it with W and follow with O-R-K.

Opportunity seldom goes to any man; man sees opportunity and goes to it.

Pat a puppy's head or a man's personal opinion, and you have 'em both going.

There's no such animal as a good, sound investment which pays fabulous returns.

Memory is a fine possession, but the softest lead-pencil note is usually more lasting.

Just because you've made a few simoleons is no reason to assume that you're immortal.

You can't be sure of anything unless you have a pre-conceived idea of what you want to be sure about.

Everything comes to those who wait; the prodigal son returns to the village old maid, and the uncalled-on staller comes to the office to make a payment—sometimes!

(Copyright, 1920, by S. A. Chandler.)

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Repitition tends to create **habit**, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

As The Editor Sees It

SOME sound advise to the Prospective builder is given in *The Architect and Engineer* by Eugene T. Taylor.

Persons who have never employed an architect, says Mr. Taylor, are apt to be at a loss as to the proper method of procedure, while many who have had some experience may not be familiar with the intricacies of architectural practice. They may not understand that architecture is a profession, calling for men of the highest integrity, business capacity and artistic ability; to command the respect and confidence as advisors, and to sustain a grave responsibility to the public. No one may have given them practical information as to the relations that should subsist between client and architect. Experience has shown that lack of information on this subject is one of the most fruitful causes of trouble in building. The following is a brief outline of vital elements in building operations:

1. The owner, who is to spend the money, as he does not and cannnot know what he is buying, must trust the architect. Therefore he should first of all assure himself that the architect is worthy of his confidence; second, that he is fitted by study of economy in plan, construction, and material to discharge this grave responsibility, in short that he has the right to the professional title.

2. The owner's interests are to secure the most available service, suitable design, best construction, most economical expenditure of funds. These can only be obtained by employing, not as a luxury, but as a necessity, an expert, a competent and reliable architect. The owner will be most benefited by choosing an architect before deciding upon anything else connected with the building project (if possible even before fixing the building site and limit of expenditure); thereby gaining from start to finish the services of the expert's technical experience and knowledge in every phase of the problem.

3. Designing a building is a process of evolution. Nothing but the full working out of the problem can produce this. The architect's goal is to lead the client to the best solution of the problem in hand. He is a sort of clearing house, in adjusting the multiplicty of ideas, wishes, needs, financial and other details. The best eventual scheme may be quiet different from that which at the start was suggested by either owner or architect. The owner should get the benefit of his architect's best ideas and various solutions of the problem, not simply what is presented to catch the attention, and "get the job;" the complete services of an expert, not of a mere draftsman. "Blue prints" are not the sum and substance of this service.

4. Do not expect gratuitous competitive designs, any more than free diagnoses, prescriptions or briefs. Plans are not like merchandise, kept in stock, to fit all individual needs; the model plan exists only for its individual place and condition; each building requires special time study and labor—the architect's capital.

5. The architect's practice is upon the same basis as that of the physician and the attorney; each is a profession, and selection should be on exactly he same principle, upon record for character, integrity, ability and fitness for the service.

6. To employ an architect on the basis of what he charges is usually wrong. It is almost always wrong when the "cheapest man is selected. "Penny wise and pound foolish" applies most appropriately to this uneconomical method.

An incompetent man selling his service for a small fee may and often does waste a great deal of money in inefficient planning, unsafe and unscientific design, unwise specification of materials, and unimproved opportunity generally. An incompetent man as supervising architect is worse than useless as he has no accurate standards of his own but is at the mercy of the builder. A competent man by his services saves the client several times the amount of the architect's fee and often earns the undying gratitude of his client.

7 Architects, like doctors and lawyers, place different values upon their services, and their services likewise vary in merit and results. This should not confuse the

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

owner—the best is likely to be the higher priced.

8. In merchandising one may buy calico or silk and pay accordingly, but there is only one kind of professional service that is worth paying for; that is the best of which the architect (or lawyer or doctor) is capable of giving. This means, generally, adherence to established standards of practice, and adequate fees. To underpay any man is to tempt him to be dishonest.

9. Make up your mind what you must have, then take the architect into your confidence as to the amount you are willing or able to expend; be perfectly frank with him. Do not try to set a price and refuse to relinquish terms and conditions which are bound to make your building cost more than you are willing to spend. Do not hurry. Take time enough on the preliminary sketches, so that you and the architect understand each other before the working drawings are started.

10. Do business only with a capable and honest contractor. Incompetence is as much to be avoided as dishonesty. "You cannot get blood out of a turnip," nor should you expect to get an honest building if the price asked is too low. Watch the work as much as you see fit, but if you have employed an architect whom you can trust, rely upon him and save yourself time and worry. You can earn more at your own business than you can save by trying to shoulder the responsibility that properly belongs to the archiect.

11. Do not violate the unwritten law which requires one head on a job. Let your instructions to the contractor be given through the architect. The contractor who comes to you with suggestions or to call your attention to real or fancied errors in the drawings or specifications should be referred to the architect. Make use of the architect's advise. That is what you are paying him for.

Do not mar your building by a wrong location, etc., or with incongruous decorations and furnishings. If you desire an effect of organic unity when the work is done, use the architect to that end.

12. Architectural service is the only form of reliable insurance that the client may purchase which gives him the right to claim that he is getting what he pays for. An architect puts selling value into a building not only because the owner can claim for the building what the architect certifies it really is, but also from the intrinsic value resulting from a good design as compared with a poor one.

13. If you follow these few hints, in all that they imply, there is no reason why your structure should cost you a cent beyond the estimated price, or why it should cost you more worry than any ordinary business transaction.

THE MECHANIC OF TO-MORROW

What is being done to train workers in the building trades to meet the big construction demands soon to come?

By R. E. Dockham

THERE is a well known poem by Sam Walter Foss entitled, "He Worried About It" which tells of a chap who realizes that some very serious things are possibly going to happen in just a few million years or so; our coal and wood supplies are going to disappear, the earth fall into the sun and several other dire catastrophes, he thinks, are going to take place. The immediate happenings such as his wife doing washing for hire and his daughter sewing shirts to support him are of too small a consequence so he does not worry about these; it's only those important things of ages to come that concern him.

We have laughed not a little about this poor chap who worried about it; the incongruity of his treatment of things rather tickles us. His attitude, however, is somewhat comparable with that of many of us in respect to our treatment of a rather alarming condition of the building trades. The fact is we are not creating mechanics fast enough and furthermore many of those we do turn out as products of our shops are far below the level, in ability, of those men of twenty-five years ago. There has existed for some years an antipathy among men of the various trades for the occupations which give them their livelihod. Perhaps this is most noticeable in the attitude of men who have sons growing into manhood.

It is quite a common occurrence to hear such men declare vehemently that their business is the most miserable ever, and that they would never, if they could help it, allow their sons to take it up. They have determined that, having had to struggle hard and long themselves, things should be a little easier for their boys; so their eyes have swept the horizon of business activities, settling finally upon one of the more genteel professions, sent the boys to college and in countless numbers of cases turned loose upon the public poor doctors, dentists, lawyers or what not, and this out of timber, fitted by nature and by the influence of generations of mechanics, which rightly directed and highly trained, might have produced wonders of accomplishment in the field of construction.

Again, the father of many a college trained lad cuts him loose from a business which he, the father, has founded and built in a mighty profitable enterprise

(Continued on Page 822.)

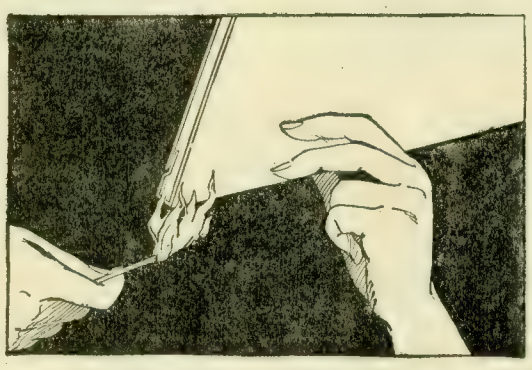
We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Is Lasting



Sheetrock is a sheet of pure gypsum rock, sheathed in a heavy protective covering. It is the standard wall and ceiling material in unit form—for new construction, alterations and repairs.

Manufactured by the special U. S. G. process and uniformly even in surface, it takes any decorative treatment: paper, paint, panels. Or it may be used in its own attractive finish of soft mist gray.

Sheetrock is fireproof too, and it cannot warp, shrink or buckle. It resists heat, cold and sound, insuring maximum insulation the year 'round.

Beautiful walls and ceilings, safe walls and ceilings, walls and ceilings that insure lasting comfort and economy—that is what Sheetrock means. Come in and inspect Sheetrock yourself, and you will see why we personally endorse its use.

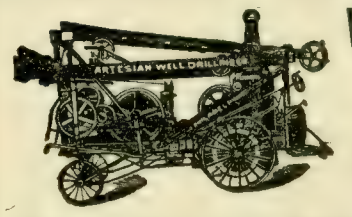
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

THE MECHANIC OF TO-MORROW

(Continued from Page 812.)

and launches him upon the sea of professional activity where he cruises about, sails all drawing, plenty of practice, for the princely yearly return of some $2,000 or $3,000, while dad himself, pointing with pride to his son, the doctor or attorney at law, nonchalantly draws some $10,000, $20,000, $50,000 or $100,000 as the harvest of his efforts in one of the more plebeian occupations of men. This is a most ridiculous attitude of mind.

Furthest from the writer's thought would it be to in any way belittle to the slighest degree the value of a college education; the importance of a well-trained mind cannot be over-estimated and any lad who by hook or by crook can get those years in college will come out with an understanding of life and the things worth while which would be difficult of securing in any other manner.

Imagine, if you can, the possibilities of a growing and thriving busness built up by the painstaking care of a father through years of honest dealing, with a reputation for quality production envied by contemporaries; imagine such a business coming, in course of time, under the management of a man fitted psychologically for its demands, and college trained. Wouldn't you look for something worth while to come from such a condition? I think your answer to this would be yes.

Prof. S., my friend and president of a Western college, a short time since, answering my question, "What are you training your boys for, in order that they may acquire monetary success?" said: "Business; of course we teach the professions, but if a lad looks forward to the accumulation of wealth he had better go into business of some sort." My quarrel is not with this but with the use it is put to when secured.

The possibilities of business, and particularly the building business in general, are very much overlooked by college men, and yet there is probably no phase of human endeavor more necessary than this. People and business must always be housed and expanding enterprises constantly need additional room.

Now, you fathers of sons, why not *your* business? It has provided you with a living and more for years; your ability to send your boys to college is the result of this business that you belittle, just because, to your way of thinking, it is a tough old game. Teach your boys the nobility of a useful occupation, teach them to believe in it as a means of doing good in their day and generation. Let them realize that the possibilities for success in this craft of yours are great and show them that to make that success will call for all the fight they have in them and the exercise of all the gray matter acquired during their school days; and above all teach them "to do good, to fight hard and play fair." So much for the attitude of the employers—being ourselves. Now look at the matter from another point of view.

The youth of America have for some time evinced a dislike for manual occu-

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

pation. In a little town not fifty miles from where I write is a deplorable illustration of energy and power gone to waste. The principal industry is one of manual occupation, in short, fishing on a large scale, a hard, disagreeable occupation we must confess. The sons of fishermen, unwilling to go into this work, go to high school and quit, and any day upon the streets of this town may be counted scores upon scores of boys, graduated from high school, loafing about the street, while their fathers, out upon the blue Atlantic, turn the bows of their sloops and schooners homeward with some ten or fifteen thousand dollars worth of fish in their holds. So, I ask you all, is an educated loafer better or more useful in the scheme of things than a financially independent fisherman?

We have been living under some false standards which now need to be changed. Too much emphasis has been placed upon the genteel professions. The manager of a bucket shop, often selling worthless securities, has occupied in many cases a higher place socially than has our biggest man in a legitimate buildng business, and we are somewhat responsible for this false attitude of mind.

The $1200 a year bank clerk looks down upon the $2700 a year journeyman carpenter or plumber and strange to say the journeyman looks up to the bank clerk, and this follows way up, or down, through the various professions; but note this: among my friends, and I believe your experiences will coincide with mine, are professional men of real ability and prominence, and yet financially I would be unwilling to change places with them and I am simply a member of one of the building trades.

New emphasis and added dignity must be placed among the the basic industries of men. We need a revival of the Pride of Craft. Young men of intelligence should be induced to enter our trades, and then be trained with an eye to the future. We have been in most cases unwilling to take up the responsibility of training apprentices; the result has been a multitude of hack workmen whose biggest interest has been the pay envelope. Their hearts are not in their work, and as a consequence, quality that goes with the endeavor of a man who loves his calling has been missing.

I sat one night as one of a group of men in the building business. The shortage of labor was being discussed and some of the far-seeing men brought up the question of the future mechanic and where he was to come from. There was not in one single shop represented by those present an apprentice serving his time, and the attendance was of goodly size.

The advisability of establishing an apprentice system was thoroughly discussed and the question put: "How many men here would take apprentices?" The count revealed two. The apprentice, as we well know, is not under present labor conditions a great asset, but we must, if we have the welfare of the business at heart, consider him potentially.

We must choose now whether we shall have, in the days to come, mechanics or Jacks of all trades and handy men. The various building industries are going to be carried on—on that point there can be no debate.

There is much to be said regarding the training of apprentices; many of the things, hard conditions, under which we operate, would today be unknown if, twenty years ago, the young men coming into the trades had been chosen wisely, trained conscientiously with a sense of fairness, recognizing their rights as future men of the business; and had received and been given just a glimpse of the various trades not wholly as trades but as branches of business, governed by business laws. Instead of this their training was left entirely in the hands of men as unfamiliar with business laws as they themselves, men who saw only an apparently well-to-do employer whose activities occurred out of sight of the men, and who looked easy money and plenty of it.

This fostered a spirit of inequality in the balance of things, laid no stress upon business ability and created from the ranks of boys graduating in a few short years into masters, a competition so keen and destructive that the building trades have not reached their proper standing in the business world today.

In closing, then, my plea is for an intelligent campaign in the interest of the future welfare and dignity of the building trades and the placing in our thoughts and words, of these trades in their proper place of importance to the needs of the men. Of great importance is the securing of the best of young American manhood to enter these trades and, finally, giving them a training which shall make them worthy of a great life's work and one which shall reflect credit upon their teachers.—*Builders' Journal.*

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

PAINTING DEFECTS AND REMEDIES

BY JOHN B. ARMSTRONG

NINE-TENTHS of the troubles which come up in regard to painting are due either to the use of a paint unsuited to the purpose or to the use of the right paint in the wrong way. There is nothing connected with building which is more puzzling and mysterious to the average house owner, and in the great majority of cases the whole subject of painting is left to a builder or to a painting contractor.

It is perfectly understandable that a paint which might be very well adapted for one purpose would be hardly suited —and possibly not suited at all—for some other purpose. In these days when many painters and painting contractors have come to understand very well the uses and limitations of paints which they mix themselves, and where each of the great concerns which produce ready mixed paints offer a paint particularly adapted for almost every conceivable purpose, there is ample range for choice,

After all, the purpose of one paint may be quite different from that of some other kind; thus the purpose of a paint made to be used upon the outside of frame houses, is first of all, to protect the wood by preventing its being reached by dampness, and its composition is made with a view to its being subjected to extremes of heat or cold or to the wet caused by rain, snow or sleet. Quite different, however, is the case of paint which is made to be used upon the inside woodwork, or inside plaster walls. Its purpose is almost wholly decorative,and since it will be called upon to stand no test in the way of moisture, heat or cold, its composition will naturally be quite different. Thus, it would be a mistake to use for exterior purposes any of the many excellent flat paints composed largely of lithopone upon the market which are intended primarily for interior use, since they are not intended to withstand the severe climatic conditions which an outside paint must endure. And yet there are customers to whom any and every variety of paint means much the same thing, and instances are on record where a painter has been compelled to use a paint which even common sense would show to be wholly unsuitable to the purpose in hand.

But perhaps the most fruitful source of painting troubles is the neglect to properly prepare the surface to be painted. Many a layman seems to think that to paint a wall or anything else, one has

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Philadelphia.

only to apply paint with a brush, but any practical painter could point out to him that the surface must first be thoroughly dry, cleansed of all grease or dirt, previous coats of paint, if any, often entirely removed, and the surface often coated with a primer—all this as a preparation for applying the paint proper.

Another cause of much trouble is due to the fact that often a work must be done with such haste that one coat of paint is applied before the preceding coat is thoroughly dry. It seems to be impossible to convince some customers that because the surface is not sticky or "tacky" to the touch it does not follow that what is just beneath the surface may not be thoroughly wet. The customer, in nine cases out of ten, insists that the new coat of paint be put on, and later on, when the paint "checks" and there begin to appear fine cracks or lines upon the surface, the blame is usually attributed to the carelessness of the painter or to some defect in the material used—very often to both. To get a satisfactory and really lasting result sufficient time must be given for the undercoat to develop at least a relative dryness, and far better results than are now obtained would be had if customers could be induced to allow one coat of paint to stand for at least one week before another coat is put on. Unless this be done there must always be some sacrifice of durability and, consequently, of satisfaction.

Much, also, depends upon the choice of the material used as a "primer"—in fact some one has said that of all the coats of paint which may be put on, the primer is the most important. When painting upon any soft wood, use must be made of a primer which has been sufficiently thinned out to enable the liquid to penetrate into the surface and to fill the fiber or pores to the point of "satisfying" the wood. Don't be afraid of thinning the paint used as a primer with too much linseed oil, for unless it be thin enough to be absorbed readily into the wood, the duty of the primer is not done. Since the wood will continue to absorb future coats of paint, their full body cannot be brought out and the appearance of the finished work will suffer.

Somewhat different, however, is the plan to be adopted where the wood to be painted is of any of the close-grained and therefore non-absorbent varieties. A larger proportion of turpentine must be used to help in killing the sap which often exists and to give a greater degree of penetration. It is hardly necessary to add that all knots or spots where pitch or sap appears are to be given a coat of shellac. Unless this be done the pitch will almost surely penetrate any number of coats of paint and spoil, or at least mar, the finished result.

It has just been said that any surface to be painted must be thoroughly dry. It is scarcely necessary to point out to a practical painter the truth of this statement but, strange as it may seem, some people have the mistaken idea that paint can be successfully applied to a wet surface merely because the painting when completed will be much exposed to dampness. The owner of a houseboat was once found to be attempting to paint the hull of his boat which had been but very recently removed from the water, and it took considerable discussion to convince him that no paint, of any kind or nature, can be successfully put onto a surface not thoroughly dry.

When it comes to the question of removing such remains of old paint as may be upon a wooden surface to be repainted, it is hard to make any rule which will fit every case. The danger is that, when painted over with new paint, the fraygment of the old paint may break loose from the wall and fall to the ground, exposing the bare surface of the wood. It would be far better to guard against possible trouble by removing the old finish by use of a heavy wire brush, by scraping, or by the use of any of the paint and varnish removers which so softens the paint that it can be easily washed off. Some one has suggested a test which may be applied to be sure that there will be no peeling off of an old coat of paint. With the blade of a pocket knife or a putty knife, merely try to pry off the old paint in several places to see if it "scales" easily and, if it does, examine the inner surfaces of the scales or fragments. Should the surface show a fine powdering or crumbling substance, it is safe to assume that the vitality of the priming coat has given way, and no new paint will adhere to the surface. Better remove it all and begin again.

It oftens seems that the painting of a house is about the very last detail which should be "skinned" or done in such a way that it soon has to be done over again. There are plenty of details to a house which are important, but which are never seen, while with painting the exact reverse is true. Strictly speaking, one never sees a house, a floor or anything else which has been painted; one sees merely the paint which *covers* the house or floor and which, by covering it, protects it from dampness and deterioration and thus preserves its life.

PEP PARAGRAPHS

Pickled people pine for brine.

A penny for your thought; a dollar for your order.

An ounce of pep is worth more than a pound of putter.

Spend less time looking at the birds and you'll get farther ahead.

Keen ears and eyes are of as much importance as an active tongue.

Don't take stock of everything you hear; follow your own judgment.

Punch might knock some guys silly; it knocks others right up in front.

A leader frequentiy is a driver, but he drives himself more than another.

We can't have everything we wish, but we can make the most of what we have.

You can't get what you want by wishing for it, but you can usually get it by working for it.

Don't be a hog. When you take a man's money, give him a smile and a word o' cheer in return.

If friendship's worth having, it's worth insuring; don't make it a bargain counter where you always get the bargains.

(Copyright, 1920, by S. A. Chandler.)

The building permits issued in 21 cities of various sizes, widely distributed over the country, show that, in values, housing construction formed 36 per cent. of all buildings in 1913; 21 per cent. in 1918, and 27 per cent. in 1919. The amount of housing construction in 1913 was exceeded in 1918 in only two of the 21 cities, and in 1919 in only six, in spite of the "build-a-home" campaign. The falling off in house construction, continues the Forest Service Report, generally appears to have been particularly marked since the later part of 1919, when the greatest upward movement of lumber prices began.

The Untied States Housing Corporation states that normally 30 per cent. of the number of buildings constructed are dwellings; that in 1919 dwellings were only 15 per cent.; that 1,000,000 families in the United States desired houses even before the war; that the shortage has since increased very rapidly; that there were 70,000 houses built in 1919, when to have met the requirements there should have been 500,000; and that in 1890 an average of 110½ families occupied 100 homes, but today 121 families occupy 100 homes.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

As The Editor Sees It

FRANKLIN K. LANE, former Secretary of the Interior, issued recently a statement, making public a summary of what he calls "the first comprehensive, carefully-made and approximately accurate picture of industrial, argicultural, financial and political conditions throughout the United States."

It discovers in the foreground, he says, that both major political parties have overlooked the greatest issue in the public mind, which is the cost of living. It also shows, he states that the country is on a sound economic basis, with the wave of extravagance subsiding,saving increasing, wholesalers and retailers optimistic over the winter outlook, and a growing disposition for hard work, although the individual productivity of labor is not yet showing much evidence of increase.

Mr. Lane's statement summarizes a survey made through 900 field represetatives of the Fidelity and Deposit Company of Maryland and covers every section of the country. Manufacturers, merchants, chamber of commerce, bankers, lawyers, business men and farmers were questioned in the effort to mirror the immediate, economic and political situation and obtain a concensus of representative opinion as to the future. The replies from all localities were made simultaneously by telegraph.

In a preface to his analysis of the survey, Mr. Lane says:

"With the Presidential election but six weeks away and the winter rapidly approaching many thoughtful people stand hesitant and undecided, having difficulty because of the general lack of knowledge of business conditions outside their own locality or interests. The general tendency has been to see what the next man thinks, with the uncomfortable feeling that his guess is no better than another's. I believe for this reason, the picture, presented in the tabulated analysis made by the Fidelity and Deposit Company, is of interest to every business man and other voters. While it is not, of course, perfect in detail and exact in prophecy, it is as clear and valuable a conspectus of present conditions as can be gathered."

Under the heading of industrial condition, Mr. Lane says: "Economically, the United States is shown to be better off than any other country in the world. There is no evidence of idleness. Our people have the opportunity to work and are at work.

"There is no shortage of raw material sufficient to curtail production reported from many of the nine geographical districts into which the country was divided for the purpose of the survey. Only in the district including Minnesota, the Dakotas, Iowa, Kansas, Nebraska and Wisconsin is there evidence of a lack of orders New England industries report a number of cancellations, but there, as elsewhere, manufactures are well filled with calls for their products.

"Transportation conditions are improving everywhere and a substantial reduction in the freight car shortage is reported in every district except in the Rocky Mountain States, in the Southwest and in the district including Kentucky, Tennessee, Alabama and Mississippi, although an improvement is noted in the latter district.

"A shortage of coal and the failure of labor to increase individual productivity appear to be the only two unfavorable aspects in the immediate industrial situation. The Rocky Mountain and Pacific States report a sufficient supply of fuel. All other sections of the country are feeling the shortage, but it is apparently least felt by the South Atlantic States.

"Although labor is costing still more than it did last year, it apparenty is producing no more. Wages have advanced from 10 to 50 per cent. in the last twelve months and yet nowhere is there reported increase in productivity per man. I am not expecting that the cost of labor will fall off even in the worst time to its pre-war stage, for I believe that the real differential between directing labor and manual labor will never again be as great as it has been.

"So far as the distribution of labor is concerned, the situation nationally appears to be well equalized. A shortage

DRAWING MATERIALS

BELL PHONE, SPRUCE 1256
KEYSTONE PHONE, RACE 614
BLUE PRINTS

of labor is found only in the Middle and South Atantic States and this is largely of unskilled workers. In the rest of the country the demand and supply appear balanced. Only in some sections of the Middle Atlantic States is any unemployment reported and this is in certain of the skilled trades, chiefly the building and shipbuilding trades.

"An important disclosure of the survey is the seriousness of the housing situation. In many of the larger industrial centres where the shortage has been most acute, the investigation of the Fidelity and Deposit Company has disclosed building operations to be decreasing instead of increasing.

"The call for buildings comes loudest from the essential places of manufacture, rather than from the retail centres, and is for low-priced dwellings. Building construction is increaing in New England, but he bulk of the construction is of factories, warehouses and stores. New York, Pennsylvania and most of the other great industrial states of the East and Middle West show a falling off in building operations. There is improvement in the housing situation in Southern and Pacific Coast industrial centres, with special emphasis on the erection of workmen's homes.

"In no section of the country did the investigators find sentiment in favor of government ownership of the railroads; and everywhere better tranportation conditions are reported.

Agriculture is generally recognized as the backbone of the country, and the farming situation is excellent; from no section has an unfavorable report been received. Our farmers appear everywhere to be in too happy a mood to permit at this time the cynicism, 'the farmer is always grumbling.' They are well supplied with funds from the sale of this year's crops, but they are wise in that they know that more favorable marketing conditions can be created.

"The recent drop in grain prices is reported to have had no effect except in the Rocky Mountain States. Farmers of Illinois, Indiana, Michigan, Wisconsin and other Central states are witholding grain.

"In the financial field, money is tight. That may mean several things: first, that the people want money badly to put into producing activities; second, that the banks attempt to get whatever the traffic will bear, shearing close to the skin; third, that there is an adequate supply of money; or fourth, that those who have money lack confidence.

"There are other reasons, no doubt, and among them that as the dollar now buys less than heretofore, people with money wish to charge more for the service that money gives. No one can accurately say which of these causes is the most important factor, but probably all contribute to the present situation.

"The telegraphic reports from every section of the country state that the banks are well loaned up, although money is available in the East and Central districts at from six to eight per cent. interest. The Southwest, Rocky Mountain and Pacific States report the highest interest rates, averaging from 8 to 10 per cent., and in the Mountain districts as high as 12 per cent.

"There is great encouragement, however, to be drawn from the fact that in only one of the nine geographical divisions, the Rocky Mountain, has here been a decrease in bank deposits during the last six months. While the general increase includes corporation deposits, individual savings accounts show a more marked improvement everywhere. This seems to show clearly that the orgy of spending and extravagance is over.

"Discounting of bills by industrial concerns is universally reported. Except in the Middle Atlantic, Southwestern and Pacific Coast states, manufacturers appear to be carrying large amounts of customers' paper.

"The country does not like the present taxation system. The Excess Profits Tax is in bad favor everywhere. Opinion is divided, however, as to a substitute. In the East and Central West, sentiment runs strongly for a sales tax, but elsewhere, opinion as to a substitute is divided.

"We are not yet masters of the art of distribution of products. The fact that the farmers uniformly report a desire for some co-operative method by which their products can be brought to consumers means that this problem is of the greatest importance. But it is not for the farmers' benefit primarily that such a movement must quickly culminate in action. The consumer feels that somewhere between the farmer and himself, too much is taken for a service of comparative insignifiance in contrast with that which the producer himself renders.

"The farmers apparently are not alone in desiring co-operative action. The survey shows opposition to co-operative movements only in the New England and Pacific Coast districts. Sentiment is divided in Ohio, Illinois, and the other North Central Western States, but favorable in the Middle Atlantic, the South Central and Southern States.

"Politically the replies indicate that it is too early to tell what the outcome of the November election will be. Three months ago, there was a stronger Republican sentiment than there appears to be now. The trend has been, and is, Republican. What it will be in November these gentlemen do not prophesy.

"The large outstanding fact developed by the Fidelity and Deposit Company seems to be that the greatest issue in the public mind is being overlooked by the campaigners—the high cost of living. I think this conclusion might well be justified, but the blame should not be cast upon the producer, and certainly the farmer has not received his share of the wealth which he creates.

"The cost of living and foreign rela-

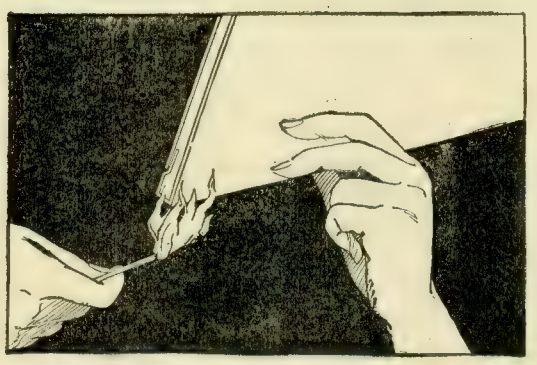
Store and Warehouse, 704-06-08 South Sixth

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Is Lasting

Sheetrock is a sheet of pure gypsum rock, sheathed in a heavy protective covering. It is the standard wall and ceiling material in unit form—for new construction, alterations and repairs.



Manufactured by the special U. S. G. process and uniformly even in surface, it takes any decorative treatment: paper, paint, panels. Or it may be used in its own attractive finish of soft mist gray.

Sheetrock is fireproof too, and it cannot warp, shrink or buckle. It resists heat, cold and sound, insuring maximum insulation the year 'round.

Beautiful walls and ceilings, safe walls and ceilings, walls and ceilings that insure lasting comfort and economy—that is what Sheetrock means. Come in and inspect Sheetrock yourself, and you will see why we personally endorse its use.

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

M., October 26, 1920, for the remodeling and repairing of the United States Custom House and Post Office at Buffalo, N. Y. Drawings and specifications may be obtained from the custodian at Buffalo, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., September 27, 1920.—Sealed proposals will be opened in this office at 3 P. M., October 27, 1920, for the remodeling of the United States custom house and post office at Providence, R. I. Drawings and pecifications may be obtained from the custodian at Providence, R. I., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

AS THE EDITOR SEES IT

(Continued from Page 828.)

tions seem to be the main issues. Taxation and industrial relations also occupy a place in the general political thought. Least interest appears to be shown in the railroad policy of the present administration, radical movements, and prohibition.

"It is clear that the country is on a sound economic basis, and there is generally a spirit of confidence in the future, regardless of the outcome of the election.

"The business outlook appears to be good in every section. Wholesalers and retailers view the fall and winter optimistically. The retailer is finding that the consumer is looking forward without fear to the winter, and his purchases from the wholesaler are founded upon this optimism. From the simple toiler up through the tradesman to the industry and the financier there runs the connected feeling of confidence."

Discussing the readjustmen period *The Corn Exchange* sees the end of Post War Hysteria and gives some reassuring facts stating:

In looking back over the post-war period, one fact stands out prominently. That fact is that most of the dire things which were apprehended never came to pass.

It is now nearly two years since the armistice. The increasing production of goods in many lines has already exerted a marked tendency on the trend of values.

While we are still far from a proper balance, business is, nevertheless, tending toward a surer footing.

Increased production, lessened extravagance, improved labor conditions—these with the promise of better transportation conditions and good crops are the factors which show that any crisis which may have confronted the country has in all likelihood been safely passed.

There is also reassuring evidence that

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

the sober commonsense of the American people is beginning to reassert itself.

There is no question that during the present year the tight money market and an overextended credit situation aggravated by most unfortunate transportation conditions, warranted some misgivings as to how the situation would work itself out.

There were no sign posts to guide the way, but as has been the case all through this remarkable post-war period, there has suddenly developed an unmistakable trend.

Perhaps the first determining factor was the realization that we have quite enough to go round,--enough food,enough clothes, enough comforts, housing conditions excepted, and even enough luxuries to satisfy with a good margin to spare.

As a result, business began to feel its way. Manufacturers and dealers became cautious and refused to take chances. Many cancellations undoubtedly had a great deal to do with this change in policy.

Speculation in merchandise and a disposition to pile up stocks for fear goods would not be available are things of the past in most lines.

If this makes for smaller average profits, it also makes for a lessened strain on credits, less inflation and ultimately a healthier price basis.

The tense money situation, while still acute enough, is not so bad as it was in commercial lines. The demand for capital funds, however, is not so easily satisfied, which is due in no small degree to the diversion of investment funds to tax free securities. Commercial funds will work into easier shape with the thawing out of frozen credits as shipments move more freely.

Moreover, the consuming power of the country will doubtless increase in volume as the fall season approaches.

With a manifest tendency towards an equalization of production and consumption, there will be less talk of Bolshevism and more thought and effort given to the rendering of an honest day's work.

The United States Bureau of Labor calls attention to the improvement in labor conditions. Immigration reports show that the influx of foreigners is limited only to steamer capacity—a condition that these columns antipicated some months ago.

During this transition period there has been demonstrated beyond cavil that the law of supply and demand, when allowed to operate unhampered by artificial restrictions, will do more than anything else to bring order out of chaos. The equalizing processes that result from the operation of this law mean in large part not only the solution of our own troubles, but of the troubles of other countries. Therein too will be found the solution to the problem of establishing a better proportion between agriculture and industry. So will the question of our foreign commerce ultimately find its answer, for we are convinced that a greater interchange of commodities between the United States and the rest of the world will be the sequel to our own condition of supply and demand here at home.

Likewise, may we look for a remedy in the housing situation. For an overproduction in one industry will divert labor into another. Arificial restrictions of labor unions may for a time hamper the working out of this process, but no organization can long arbitrarily prevail against the pressure of men seeking an honest livelihood.

Reviewing then, the conditions that confront the country at this time, there is much to be thankful for:

First. The railroad problem, so fraught with ugly possibilities, is in process of soluton.

Second. Crops on the whole will be good.

Third. The labor situation is improving.

Fourth. There is a widespread demand for a wise revision of our tax laws.

Fifth. The slackening up in some lines of business will probably be followed by greater activity in others.

Sixth. Our supply of funds for commercial and capital needs, if properly distributed, is adequate.

Seventh. The post-war hysteria, with its irrationalism and radicalism, is giving p'ace to a saner conception of the things that make for orderly progress.

Prophesy is cheap. We shall not attempt to forcast conditions a year ahead, but it is fair to assume that competition in our own markets and in our markets abroad may become keener. Competition sharpens men's wits. Competition developes initiative, promotes efficiency and stimulates the inventive faculties.

Wt have entered another phase of this remarkable period of readjustment. If a truer exchange of values, whether in labor or in commodities, is in order, the country is thereby tendered a blanket policy against a repetition of the excesses of the past year; while business, too, can then proceed to make its calculations with more confidence in the future of values.

"There is no general expectation that by postponing new building for a new months, marked savings may be realized through future declines in prices," says the Guaranty Trust Co. "Even should the long-desired definite recession in prices develop it is believed that for some time yet building costs will show at best but slight decline and many think there will be further advances in building costs generally.

"The raw material for building are available in abundance, sufficient to support the most ambitious building program and in the lumber industry it is estimated that there is an excess plant capacity of 50%. The supply of materials may therefore, in many cases, promptly be enlarged whenever demand calls for it.

REMOVAL NOTICES

Amos W. Barnes, Architect, formerly of 1507 Arch St., Philadelphia, has moved his office to the Fuller Bldg., at 10 S. 18th St., Bell phone Locust 69-48.

Hance, Neely & Mitchell, Architects, have left their old quarters at 1619 Chestnut St., Philadelphia, and have opened offices at 2126 Pine St. Bell phone Locust 26-37 W.

I. W. Levin, Architect, 536 Ritner St., Philadelphia, has moved to the Mutual Life Building, 1001 Chestnut St. Bell phone, Walnut 67-73.

F. J. Wilson Company, Fireproofing Specialties, are located at their new offices 305 Otis Building, 16th & Sansom Sts., Phila.

Durham Brothers announce the removal of their offices from 26 South Fifteenth street to 1611 Sansom street, Philadelphia. Bell phone, Locust 1706; Keystone phone, Race 5481 A.

David B. Bassett, formerly in the Perry Building, announces the removal of his offices to 1520 Locust street. Bell phone, Spruce 2626.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

As The Editor Sees It

The Committee on Education and Information of the Council of the Associated Building Trades (American Federation of Labor), of Philadelphia, composed of D. Knickerbacker Boyd, Chairman, and A. G. Haws, D. T. McKenna, W. J. Haggerty, and J. S. Meade, submitted to the industrial relations committee of the Chamber of Commerce of Philadelphia a statement of a program which the labor body favors for the promotion of harmony and co-operation of employers and employees of the building trades.

The communication presented in regular order the following propositions:

1. The whole hearted services, and equable representation on Committees, of both employer and employed are essential to the success of any industry.

2. Employees desire to assume their share of responsibility in management.

3. Employees desire employers to co-operate with them in bringing young men into the building industries.

4. Similar co-operation in providing instruction, training and experience for apprentices, is desired.

5. Similar co-operation is sought in making the day's work of more interest and the prospect of the next day more exhilarating to journeymen now in the trades.

6. Similar co-operation with respect to bettering conditions of working and living, is also desired.

7. Employers and employees organizations to co-operate in perfecting each as instruments of service.

8. Employers, architects and engineers to attend meetings of workingmen, take part in same, secure first hand knowledge of employees aims, offer advice and afford assistance.

9. Employers to organize, where not now organized in each industry.

10. These organizations to affiliate as one organization in the building industry.

11. These organizations to affiliate with similar organizations of employees.

12. The combined organizations to function as a Tribunal or Council of the Building Industry.

13. This Tribunal to have working Committees on Apprentices, Journeymen, working conditions, materials and methods, and others to eliminate strikes, lockouts and economic ills which retard progress.

14. This Tribunal or Council to work also for improvements of all conditions surrounding the building industry as a factor in the development of the community.

Draft of Program

(a) As we hold the service of the employed to be of equal importance to the service of the employer with respect to the welfare of any essential industry as well as to the entire community, we feel that any properly constituted Industrial Relations Committee—whether of a single industry or of many industries—should have equable representation from employed as well as employer.

(b) We believe this to be necessary in order to accomplish the purpose set forth in Statement No. 1 of the 1920 Declaration of Principles of the Philadelphia Chamber of Commerce, which Statement No. 1, we fully endorse. The same purposes are also set forth in Statement No. 1 of the 1920 Social Justice Platform of the Central Conference of American Rabbis, which Statement No. 1 we heartily endorse as we do all others of the six statements promulgated in that Social Justice Progress.

(c) By expressing the belief that it should be admitted to the Councils of the employers labor does not wish the inference to be drawn that it merely seeks a recognition of its rightful share in such of the employers' deliberations as are of mutual concern. Rather is it to be understood that labor desires to assume its proper proportion of the responsibility connected with the management of any industrial enterprise.

(d) But without insisting upon compliance labor does, however, seek to have what it considers of far more importance, —the active co-operation of the employers in developing the human-interest side of industry and the technical phase

DRAWING MATERIALS

1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

of craftsmanship. Labor feels also that the employer should not leave to it alone the onus and responsibility of bringing into each branch of the building industry that young blood, brawn and brains which should be attracted through appreciative interest and the means of intelligent choice, into these trades and diverted from less strenuous, health building, manly occupation. It therefore requests the support and co-operation of employers in encouraging young men to enter the ranks of the building trades and in providing the instruction, training and practical experience requisite for apprenticeship.

(e) In making this request we desire to emphasize the fact, apparently not heretofore recognized by the majority of employers, that those employed in the Building Trades are actually entitled to the assistance and co-operation of employers in securing, training and perfecting the human raw material out of which workers in these industries are produced and in making of the material more genuinely interested and efficient mechanics, workers and citizens. To this end we further request co-operation in providing additional means of interesting and informing the journeymen already in the trades and crafts. This relates not only to those men in labor organizations at their regular meetings through lectures, illustrated addresses and informal talks, but to all the men in shops, in the field and on the job through furnishing the means of more imtimate contact with their foremen and employers—and with the architects or engineers whose directions and desires it is aimed to follow.

For years those employed in the building industry have been giving their time, energy and means—almost alone so far as employers collectively are concerned, —to develop their organizations as instruments of service in their respective branches. If mistakes have been made, we feel that this is all the more reason why we should have the fullest co-operation of employers and of architects and engineers in the satisfactory solution of all problems.

(f) To accomplish these important ends and thereby to eliminate misunderstandings, strikes and other economic ills, labor hereby sets it down as a requirement of first consideration that all organizations, groups or committees of employers shall recognize their responsibilities toward brother workers and shall function with all organizations of employed and with committees or groups where no such organizations of labor exist.

(g) We therefore invite and request representation of employers or of their organizations and of architects and engineers at regular meetings of labor organization or at meetings of workingmen where not organized, to take part in discussions and movements for the betterment of service on the part of the employed and of conditions surrounding their employment and perhaps their living accommodations. This requirement is stipulated in order that workingmen may have the benefit of the knowledge and experience of those others interested in the welfare of each industry so that all may serve the general public to the best of their abilities.

This is stipulated also in order that these other elements in the building industry may be afforded the opportunity, through closer contact with workingmen, to understand their aims and aspirations. Also in order that such representatives, in addition to assisting through this participation may be in a position to report to their organizations or associates what present activities might in their opinion be discontinued, increased or improved upon through that intelligent constructive criticism heretofore lacking by reason of the absence of opportunity to secure first hand knowledge.

This requirement is formulated not only for the benefit accruing therefrom to the industries themselves but to the workingmen individually. And among these, we include all workers in Philadelphia and vicinity regardless of labor affiliations, race, color, or creed, stipulating only that they should be, or intend to become, law abiding, self-respecting, industrious citizens of the United States.

(h) To put into effect the purposes set forth in this proposed program, the following plan of organization and activities is outlined for your prompt consideration. It is hoped that by its adoption, either as submitted, or in such modified form as may be suggested at the subsequent meetings with your Committee which we are hopefully anticipating, that all misunderstandings may be cleared up, strikes eliminated, efficiency encouraged, production increased, the building industry stabilized and that the construction of houses and all other necessary buildings and utilities of which this community is so sorely in need may be proceeded with before the approaching cold weather is too close upon us.

Outline of Proceedure for Application of the Philadelphia Plan in the Building Industry

(a) The organizing through Associations, Groups or Committees where such do not now exist, of each employing branch of the building industry in number at least equal to the nineteen represented in the Council of the Associated Building Trades plus one more constituting the carpenters not at present associated and one for each group or committee of workers desiring representation.

(b) The joining together of all these Associations, Groups or Committees into a permanent, well organized Building Trades Employers Association with offices and officers.

(c) The appointment in each branch of the building industry of Committees of employers. These Committees to consist of one main committee in each branch. This committee to be divided into say

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Important Notice

The Barrett Specification Type "AA" 20-year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can point to many roofs of this type that have been in service over forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof bonded for 10 years.

Both roofs are built of the same high-grade waterproofing materials, the only difference being the quantity used.

"When it comes to writing Roofing Specifications—"

Our sixty years' reputation in the roofing business enables us to place at the disposal of the architect and his client, a "definite" Roofing Specification that has been proved by the most exhaustive experience to give those "better results" advocated in the American Architect editorial herewith.

This "definite" specification is *The Barrett Specification.* It is a formula for built-up roofs which most architects endorse. Any reputable roofing contractor can fill the prescription and the owner is assured of a roof with the lowest cost per year of service.

Full details regarding these Bonded Roofs and copies of the Barrett Specification sent free on request.

New York, Philadelphia, St. Louis, Cincinnati, Detroit, Birmingham, Salt Lake City, Milwaukee, Youngstown, Bethlehem, Kansas City, Seattle, Bangor, Toledo, Elizabeth, Omaha, Minneapolis, Peoria, Washington, Columbus, Buffalo, Houston, Dallas, Atlanta, Johnstown, Richmond, Baltimore, Denver, Nashville, Duluth, Lebanon, Latrobe, Syracuse, Jacksonville, Chicago, Boston, Cleveland, Pittsburgh, New Orleans

The Barrett Company

THE BARRETT COMPANY, LIMITED: Vancouver, St. John, N. B., Montreal, Halifax, N. S., Toronto, Sydney, N. S., Winnipeg

The Definite Specification

From Editorial Page, American Architect, N. Y.

"THE physician who made a practice of prescribing certain drugs or others whose * * * * * properties were similar — would soon lose the confidence of his patients, and yet that is in effect what the architect is doing who persists in the outworn and discredited practice of writing 'or equal' after the specification of a given material. * * *

"Unless he entirely neglects to perform his function and leaves the decision to the builder, he must sooner or later determine what is to be used and, considered both from the standpoint of the client's interest and his own reputation, it would seem to be desirable that he * * * * * make his decision *when the specification is written* rather than *after the contract is let.*

"The old argument, * * * * that a definite specification fosters high prices, has been effectually disposed of by leading architects. * * * * It is evident that no manufacturer of standing and responsibility would take advantage of a definite specification to increase his price. To do so as a policy would be business suicide. * * *

"If there is but one article or material that will, in the opinion of the architect, give better results than any other, he should have the moral courage to specify it outright."

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Cannot Warp

U.S.G. SHEETROCK

Makes Rigid, Warp-Proof Walls

A sheet of pure gypsum rock, encased in a heavy protective covering—tough, rigid and durable—Sheetrock cannot warp, shrink or buckle. This standard wall and ceiling material in unit form is fireproof too. Uniformly and permanently even in surface, it takes any decorative treatment: paper, paint, panels. It resists heat, cold and sound.

And Sheetrock is put up quickly, economically. Made by the special U. S. G. process, it can be sawed and nailed—as readily as lumber. The nailing strength is reinforced by the U. S. G. Patented Reinforcement.

If you are thinking about building a new home, or perhaps just a play room for the children, a spare bed room, an attic room, a laundry, a clothes closet, or a sleeping porch, it will pay you to learn more about Sheetrock. We will gladly provide you with complete information.

SHEETROCK

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

A Complete Line of Moulding and Studding to be used with Sheetrock

Wetmore, Acting Supervising Architect.

AS THE EDITOR SEES IT

(Continued from page 844)

four sub-committees of about three members each to meet with and function with, like Committees from the Council of the Associated Building Trades or with Committees of any branch of labor in the Building Industry not organized or not connected with said Council.

Each of the sub-committees suggested, if consisting of six members as indicated, to have a seventh member as Chairman, which member shall be an Architect or an Engineer selected by vote of the other six members. The chairman of the main Committee in each industry and a Secretary to be selected from among the Chairmen of the sub-committees.

(d) The sub-committee of the main committee now suggested for your consideration and for later joint deliberation are:

Keystone Phone: Park 839

This Committee would study the system evolved and maintained by unionized labor to see in what way it may be improved.

This Committee would ascertain also in what manner closer affiliation with the public schools and vocational training institutions in the Philadelphia District may be effected as well as how the system of indenture may be perfected through increased opportunities to be afforded by the employer. Native ability and individual initiative on the part of apprentices should be encouraged.

This Committee would work also with State and National Bureaus or Departments of Vocational Training where such activities will be mutually advantageous.

It is suggested that the present "Business Agents" of the Labor Union would become vocational officers, for through the effective operation of the Tribunal later mentioned, the services of these business agents may be devoted almost wholly to vocational training instead of only partially so as at present. This is but one of the economic features of the plan proposed.

Committee on Information for Journeymen: This Committee would maintain contact with the workers in the manner indicated in the program. It would provide speakers from the organizations of the employers and from producers and manufacturers of the materials connected with their industry, from allied industries, from national, state and municipal officials and authorities in these and other technical or educational fields in any way qualified to instil into the worker a greater familiarity with the materials, methods, tools and traditions of his own particular craft. Achitects and Engineers too, have been found who are willing and able to talk to and confer with the workers, to learn as well as to teach and to cause each to feel that his task is one of no mean importance and can be made, through interest and appreciation, to assume proportions measured by the satisfaction to be derived from a job well done.

As an instance of the possibilities which surround such proceedure the case of Bricklayers Local Union No. 1 need but be cited. Several Architects attended a preliminary meeting with the Bricklayers in the fall of 1919 and at subsequent meetings the men were addressed by persons prominent locally and nationally. These included officials of the Master Builders' Exchange, the Philadelphia Housing Association, the Board of Education, the Brick Manufacturers Association, the University of Pennsylvania, the U. S. Bureau of Standards, the Associated Metal Lath Manufacturers and others. An Architect during the last season conducted a constantly growing class on Plan-reading which together with the addresses and discussions just mentioned has had an effect upon the art of bricklaying which has created the greatest enthusiasm among the men in this locality and caused most favorable comment throughout the country.

Committee on Working Conditions: This Committee would co-operate with City, State and National Officials, Manufacturers, and Organizations in regard to Safety Codes, Fire-prevention, Scaffolds, Sanitation, Ventilation, Illumination and conditions in general as relating to mines, quarries, shops and to buildings during construction. This Committee to work for everything which will promote health, safety and efficiency in the building industry.

Committee on Materials and Methods: This Committee would be expected to familiarize itself with building code provisions, local material markets and conditions, to co-operate with city Building Inspection Departments, architects and others, to carry on research work and investigations in buildings undergoing construction, alteration, repair or addition, and by this and other means to determine facts wherever possible in relation to the characteristics of materials and to the methods best calculated to insure against decay, deterioration, or defects. Workers on buildings may assist those entrusted with the planning of buildings, execution of contracts and the inspection of structures by forming through this committee a clearing house for observations, the making of which and reporting thereon with subsequent discussion should be stimulated.

Finally: Heading up Committee to constitute the Tribunal or Council of the Building Industry for the Philadelphia Territory.

With the before mentioned program in effect the next step, which in reality would be collateral, would consist in the creation of a Tribunal or Council of the Building Industry for this locality.

The program now presented for your preliminary consideration contemplates creating this tribunal in the following manner and vesting it with the authority indicated.

To consist of one representative from each of the Main Committees in the Employers' Organizations or Groups, not less than nineteen, each selected by vote of the main Committee in each branch of the Industry.

And of one representative similarly chosen from the organizations or groups of the employed, not less than nineteen in all.

The officers of this Tribunal would, it is suggested, consist of a Chairman, two Vice Chairmen, a Recording Secretary, who would also act as Treasurer, and a Corresponding Secretary.

These offices to be filled as follows:

The two Secretaries to be the Secretaries of the Building Trades Employers' Association and of the Council of the Associated Building Trades. The two Vice Chairmen to be respectively the Presidents of these two organizations. The Chairman to be an architect selected by the entire Committee.

This Tribunal or Council would become the strategic board for the consideration and possible solution of all problems affecting the building industry as a whole and their relation to all factors in the community. It would have power to elect, and delegate certain authority to, an Executive Committee, to formulate rules of procedure, and to assign to any sub-committees of the Tribunal certain prescribed duties. Among these would be the adjustment of matters relating to conditions which might lead to strikes, lock-outs and other economic ills.

Fall Frolic of Philadelphia Builders' Exchange will be held Wednesday afternoon and evening, October 13, at Lu Lu Temple Country Club, North Glenside, Pa. Golf, pool, billiards, shuffleboards, cards, baseball, concert and vaudeville show. The Entertainment Committee assures all a most enjoyable outing.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

As The Editor Sees It

THE ONLY REMEDY FOR THE HOUSING SHORTAGE

BY HENRY J. GIBBONS,

Attorney-at-Law and Member of Real Estate Board of Philadelphia

In 1884 John Wanamaker secured the last of the twenty pieces of ground comprising the lot which underlies his store at 13th and Chestnut Streets. He had been assembling this tract since 1875. During the ten years he paid for this ground 250 feet front on Chestnut by 474 feet north to Market Streets, $1,220,000. For thirty years he conducted there in a row of transformed brick dwellings on Chestnut Street and a former convention hall on the Market Street end (the City having obligingly vacated Kelly Street which formerly ran from 13th to Juniper 150 feet north of Chestnut) the splendid business which has made his name known all over the world. Then he commenced the erection of the massive 12 story structure of which the city is justly proud.

There went into this beautiful building the mental effort of an architect and his draughtsmen, as well as the engineer who superintended the work for Mr. Wanamaker, and the millions of foot-pounds of manual labor of all who toiled towards its completion. But all this mental and physical labor extending over a period of several years did not succeed in placing there when the great store was done value in excess of one-half what the 2¾ acres of dirt underneath it was worth. There stood the magnificient property, unique in location and floor space, but the ground was worth $12,000,000, and the building $6,000,000. Today both are worth more, the building probably $8,000,000 and the ground $15,000,000.

We have indicated who created the value of the building and all readers of this magazine know that the men who made that thing were paid for what they did. They added to the world's wealth. They earned money for their services and the material they had manufactured and supplied. And they were all entitled to it. Furthermore they were entitled to all of it, but the benevolent government under which we dwell took a good part of their earnings from them in the form of income tax, personal property tax, tariff duties on imports bought by these men from American shopkeepers, various excise taxes, license taxes, real estate taxes on their homes, factories, offices and shops. The government said it needed this money to keep its wheels oiled and itself from going out of business, 90% of it going to prepare for future wars and pay for wars that have been fought.

Very good. Such is life. We seem used to it. Some grumble at the increased taxes and high prices, but few are willing to exercise their brains and discover the cause of the trouble, the vicious circle we seem unable to break.

Returning to Wanamaker's Store, who created the increase of land value of $11,000,000 between 1884 and 1914? Every person who moved into the city during that period, every baby born in the city and all the people who lived here and hustled for food, shelter and clothing for themselves and their families. All right. Now who *got* the increased land value of $11,000,000? John Wanamaker. Did he earn it? Not in my opinion; nor in his own either. But the system not only permitted him to pocket it, but enabled him to borrow on the security of it $10,000,000. from the Land Title and Trust Company on first mortgage. Six per cent. on this mortgage is $600,000 each year, which he pays and collects in turn from the concern operating the store, John Wanamaker—Philadelphia, which in turn adds enough to the price of goods and refrains from adding enough to the wages of clerks in the stores to make up the amount. There you have it.

But don't misunderstand me. I'm not criticising this merchant prince, as an individual. He has been one of our greatest and most useful citizens and all should do him honor. IT IS THE SYSTEM WHICH ENABLES AN INDIVIDUAL TO ABSORB AS PRIVATE INCOME COMMUNITY CREATED VALUE. There is the trouble.

Furthermore, what did the individual do in this example to entitle him to this

DRAWING MATERIALS
CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614
BLUE PRINTS

enormous sum? What manual or mental labor was furnished? None. It was altogether unearned.

Now, when some get what they don't earn, as certainly as night follows day, many others earn what they don't get, for the money has to come from somewhere.

But what has all this to do with the stringency of housing? Everything. It causes the cost of everything to be too high for any contractor to risk operative building on a sufficiently extensive scale to supply the demand for dwellings. This situation has existed in an increasingly aggravated form in this city for ten years. During that period the marriage licenses issued,minus the divorces granted (even though divorcees and their children must live somewhere) and making due allowance for a natural death rate and the flux of population, have far exceeded the number of houses erected.

Among the deterrents to building has been the high cost of land, for houses must have ground to stand on and three fourths of the area of the city has no structure on it, BUT IT IS ALL FOR SALE AT PRICES FAR IN EXCESS OF PRE-WAR FIGURES. To get anywhere with our building program, WE MUST HAVE CHEAPER LAND. The present system of multitudinous indirect taxation is an encouragment to hold land out of use, to buy it for speculation rather than use and to hold it at a high figure. We boast of the total of our land value in Philadelphia, $2,500,000,000, as something to be proud of.

But why should we rejoice in obligating ourselves to pay private individuals six per cent. on that amount each year, $150,000,000 or $85 for each man, woman and child. Remember, this makes an annual payment of $425 for every family (on the average basis of five members) before any of the regular direct taxes are taken into consideration to say nothing of the enhanced cost of every item of food, clothing and shelter by reason of the tariff and other delightful indirect taxes, the kind "we don't feel" because we don't see the incidence.

Land value cannot be hidden. There it is easy for every one to see. It would be easily appraised and collected, a single tax on land value; so we could then dispense with all the perjury surrounding the general property and income taxes, to say nothing of the horde of tax collectors and inquisitors as to our honesty. The cost of collecting all the petty taxes of today is appalling. The minimum expense would be entailed in securing this unearned increment for the community. As a result of the imposition of this tax, all such burdens would be removed from buildings and other improvements on land. No tariff or licenses would remain in vogue.

An enormous stimulation to building would result from cheapening the land, from the reduction of the price of material (due to the elimination of so many indirect and direct taxes that are added to the price of the goods), and the lifting of the intolerable burden under which industry staggers.

We tax dogs to reduce the number. In France where there was a tax on windows they built houses without them frequently or with as few as possible. We can't destroy houses by taxing them, but we can discourage their construction by continuing our present foolish methods. Instead of taxing for building and improving a lot, encourage the man by exempting all of his improvments and put the burden on the land. It can't run away, there will always be plenty of it. But we can cut down its cost, that is the important thing for readers of the BUILDERS' GUIDE to remember.

You can count on one hand the successful builders who have never been bankrupt, but you seldom hear of bankrupt land speculators. They "own" the commodity all must have to live, as essential to existence as light and air and water. Don't let these gentry, who are so numerous and ubiquitous on Real Estate Boards, pull the wool over your eyes. Tell them that you understand the single tax and it appears to you a good thing for the average man who earns his living by work, but a bad thing for the parasite who lives on the work of others and toils not himself at all.

* * *

August building statistics reported from the larger cities of the country show, according to the *American Contractor* that while there has been no perceptible gain over the preceding month's activity, the mere fact that there has been further recession is encouraging because during August the unfavorable influences hampering building have been itensified. During the month the advanced freight rates resulted in additions to the high prices of materials. The fact that building permits show no recession coupled with the fact that a better condition in transportation can reasonably be expected to take place, leads to the conclusion that the last four months of 1920 may see augmented plans for much needed building.

The valuation of permits from 177 cities for August, 1920, is $110,937,493 as against $161,977,270 for the same cities for the corresponding period in 1919. The number of permits has shrunk from 34,893 to 32,852. August,1919, was, however, the peak month in 1919 and from then on recession took place. This year April was the spectacular high month, after which building suffered adverses from unfavorable external influences. Chicago has suffered greatly the past month by the factors obstructing construction and August permits show over a million dollar decline from July. In one borough in New York City, Manhatten, on the other hand, there is shown a gain of over eight million,so that losses in one section are offset by gains in another and considering the country as a whole, more cities show gains than losses.

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Modern farm group with inside entrances to the buildings. Illustration shows them roofed with red Everlastic Multi-Shingles (4-in-1).

Barrett Everlastic Roofings

Right— From Every Standpoint

Nobody knows better than a Builder that "half the job is *in knowing how*"—the other half is in using the right materials. This applies just as much to *making roofing* as it does to *laying roofs*.

Barrett Everlastic Roofings are made of the very best grade of water-proofing materials. And all the knowledge and skill we've gained in 60 years of manufacturing experience go into them.

Which means that these roofings are *right* from every standpoint: they're low in cost, quick and easy to lay, and they give long, trouble-free service.

EVERLASTIC MULTI-SHINGLES
(four Shingles in one)

The newest thing in roofing. Tough and durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look exactly like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting to a high degree. Need no painting.

EVERLASTIC SLATE-SURFACED ROOFING

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable, requires no painting. Nails and cement in each roll.

With two styles of shingles and two style of roll roofing to choose from, you'll find Barrett Everlastic Roofings offer just the thing for every roofing job. Three of the four styles are surfaced with crushed slate in permanent, rich color-tones of red or green. No roofings at any price are handsomer.

Barrett Everlastic Roofings will prove good advertisements for you and good investments for your customers.

Send for our free illustrated booklet. It fully describes all four styles of Everlastic.

Carried by enterprising dealers everywhere.

EVERLASTIC SINGLE SHINGLES

Same materials and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8x12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof, and, in addition, costs less per year of service.

EVERLASTIC "RUBBER" ROOFING

One of our most popular roofings. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement in each roll.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Is Lasting

Sheetrock is a sheet of pure gypsum rock, sheathed in a heavy protective covering. It is the standard wall and ceiling material in unit form—for new construction, alterations and repairs.

Manufactured by the special U. S. G. process and uniformly even in surface, it takes any decorative treatment: paper, paint, panels. Or it may be used in its own attractive finish of soft mist gray.

Sheetrock is fireproof too, and it cannot warp, shrink or buckle. It resists heat, cold and sound, insuring maximum insulation the year 'round.

Beautiful walls and ceilings, safe walls and ceilings, walls and ceilings that insure lasting comfort and economy—that is what Sheetrock means. Come in and inspect Sheetrock yourself, and you will see why we personally endorse its use.

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

Reinforced concrete and steel, 1 and 2 stories, irregular sizes, to cover area of 12 acres, slag and composition roofs, steam heating, electric lighting, rolled steel sash, elevators, sawtooth skylights. Plans in progress. Engineers will take bids in one month.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

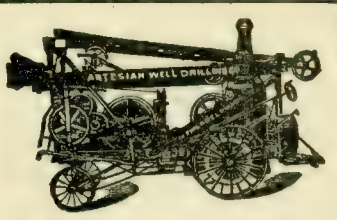
You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.



This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., September 30, 1920. Sealed Proposals will be opened in this office at 3 P. M., October 21, 1920, for remodeling Registry Room in the United States Post Office Building at Buffalo, N. Y. Drawings and specifications may be obtained from the Custodian of the building at Buffalo, N. Y., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 11, 1920.—Sealed Proposals will be received separately, for the different materials and for labor by the different trades, and opened in this office at 3 P. M., November 8, 1920, for the construction of the United States Post Office at Front Royal, Va. Materials required will include concrete, reinforcing metal, stone, granite, brick, structural steel, structural terra cotta, miscellaneous iron and steel, composition roofing, waterproofing, sheet metal, plastering, interior marble, sanitary slate, lumber, millwork, painting, hardware, plumbing, heating, electric work, etc., in accordance with drawings, specifications, and bills of quantities attached thereto, copies of which may be obtained from the Custodian of the site at Front Royal, Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

The stated meeting of the Master Builders' Corporation will be held on Tuesday, October 19th, 1920, at 1.30 P. M., for the purpose of considering and adopting proposed amendments and changes in charter and by-laws of this corporation.

Nominations for seven (7) Directors, to succeed those who terms expire at the end of the current year shall also be made at this meeting. These are made of the following classes: Building Contractor, Mason Builders, Painting Contractor, Plastering Contractor, Plumbing Contractor.

PARTIAL EXEMPTION OF HOME MORTGAGES FROM TAXATION

The New York City Club recommended to the Special Housing Session of the State Legislature, the appointment of state housing boards and use of state credits to apply to housing at low interest rates, without loss to the state, in obtaining homes for the workers. The Club opposes exemption of mortgage income from state and federal taxation but advocates local tax exemptions on single and multi-family houses for a limited period where construction is begun within one or two years after the law goes into effect, although taxes would still be levied on the land. This exemption would stimulate house building but not interfere with the necessary raising of public revenues.

VULNERABLE POINTS IN RESIDENCE CONSTRUCTION

That residences can be made measurably firesafe by protecting the vulnerable points with a base that will hold the plaster with a perfect key is being advocated by the Associated Metal Lath Manufacturers. Such protection as they advocate adds but little to the cost of construction, as they do not demand that metal lath be used throughout the entire house.

The vulnerable points selected are as follows:

1. All bearing partitions and studs in exteorior walls, including a basket to hold incombustile material as a fire stop.
2. Ceilings under inhabited floors, especially over heating plants and coal bins.
3 At chimney breasts, around flues and back of kitchen ranges.
4. Stair-walls and under-stairs
5. As a base and reinforcement for exterior stucco

N. J. LEGISLATURE MAY ADOPT NEW HOUSING BILL

A series of four bills designed to relieve the housing shortage which is now so acute in northern New Jersey, were introduced by the Legislature.

One of the housing bills provides that municipalities be given the power to adopt ordinances and inflict penalties wherever necessary, so as to protect the tenant against unjust discrimination.

Another of the bills exempts from taxation all improvements to real estate which are erected solely for dwelling purposes for five years from October 1, 1920. This exemption is made with this provision: That assessment for improvments shall in no case (except damage by the elements) be less than assessments for existing improvements on the real estate.

The third bill provides at least three month's notice for all tenancies from month to month, or less term where no term is fixed. This does not apply to farm letting, to notices served under existing laws, where tenants are disorderly, etc.

The last of the bills requires assessors to find out as fully as possible the possible cost of property, if it came through purchase, the rentals demanded or received from premises, and to take these two clauses under full consideration as two of the elements entering into and comprising values.

PEP PARAGRAPHS

A bluff's the stuff until it's called.

Some folks would rather travel than gravel.

Rain spells gain for the man who's on the job.

A man who's up in his line is seldom down in the mouth.

Enthusiasm is the motive power which speeds up a sale.

You get from life and marriage just what you put into them.

Progress is a slow, steady climb; retrogression is a toboggan.

Just because it'll come out in the wash is no reason for not trying.

You can't bring back what you've lost, but you can create something new.

Hard work, determination and foresight; they're the boys who bring home the bacon!

It's not the amount of time you spend on a certain venture that counts, but the way you spend it.

If you aren't getting what's coming to you, go to the guy who can give you what you want and let him know that you're living.

(Copyright, 1920, by S. A. Chandler.)

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

Heat the Whole House Cut Fuel Bills

There are no cold rooms in the home heated by the Pawnee Pipeless Furnace. This simple, efficient system maintains an even temperature of 70 degrees throughout the entire house even in zero weather at a fuel saving of from 25 to 40 per cent. No pipes, no repairs. No coal gas or dust. Low initial cost. Easily installed in about a day without tearing up walls. Burns hard or soft coal, coke or wood. Write for illustrative booklet.

As The Editor Sees It

OPTIMISM is the prevailing sentiment pervading business throughout the country today, and, in spite of the temporary set back which construction has received in the last few months, every one is preparing for great activity in building in the near future. The demand is there, and adjustments are under way to overcome the difficulties of the present situation. One of the greatest of these is the scarcity of money available for mortgages. Senator Calder is interested in this plan of the situation and suggest a revision of the excess profits law and a modification of the surtaxes so as to bring back to the building industry money that is now being put into tax exempt securities.

The *Builders' Journal* tell us that the Associated Metal Lath Manufacturers in a recent bulletin urge all connected with the building industry to take an active part in getting national legislation passed that will exempt mortgages on new homes from taxation.

The bulletin states that banks were obliged to stop construction loans, not because of prices of materials, but because they could not dispose of real estate mortgages to their customers. This was largely due to the Federal Income Tax which, with its heavy Surtax on the larger incomes, makes mortgage buying at 6% absolutely impossible. No one can blame the man with an annual income of $50,000 for refusing to make investments that will yield but $412 on every $10,000 when he can easily get $600. In the case of an income of $30,000 invested in mortgages there are Federal Normal and Surtax charges levied, making a total of 21% which must be deducted before the net income to the investor is found.

Investors are therefore putting their funds into municipal bonds which are tax exempt. To compete with these 6% bonds the banks would have to offer 7.6% interest on a taxable mortgage to an investor with a $30,000 income, or 8.7% to the $50,000 investor if he were to come out even. With mortgages tax exempt, however, they could readily be sold on a 5% and 6% basis.

Pessimism never does any good, but when optimism is backed up by sound economic conditions such as exist in the country today, there is every reason to look for success ahead. To quote Judge Gary:

"Optimism and hard work are what the country needs now."

We believe there are good prospects for harder work on the part of labor than has been in evidence recently, as the *National Builder* reports that in Detroit "some of the bosses declare that with them, labor efficiency has come back to where it was in 1914."

The impractical dreamers are not the architects, but the clients themselves, as a rule.

WORKINGMEN FAVOR OPEN SHOP

The practically unanimous approval of the open shop idea by the Chamber of Commerce of the United States prompted Samuel Gompers, president of the American Federation of Labor, to make a vicious attack on employers favoring the American plan. He denounced the open shop as an interference with the right of workers and declared it to be one of the coercive measures used by capitalists to injure labor. A splendid answer has been made to Mr. Gompers by C. Wilbur Miller, president of the Davison Chemical Company, Baltimore, in which he says:

"Mr. Gompers assumes, first, that he, as president of the American Federation of Labor, represents and speaks for the workingmen of the United States; and, second, that all employers are only thinking of themselves in approaching questions relating to labor. There is not the slightest foundation for either assumption, and it is because Mr. Gompers spends part of his time with the American Federation of Labor officials, who make themselves believe these conditions exist, and the rest of his time trying to convince the politicians his assumptions are correct.

"It makes very little difference what Mr. Gompers or his official family believes, but the American public and poli-

BLUE PRINTS

ticians should know that the American Federation of Labor only represents a very small minority of workingmen, and many of this number are aliens without the suffrage. The employers represent the majority of American working men, and when they vote for the 'open shop' they cast the vote for this majority, as it is in this way they can be heard. If they did not vote for the 'open shop' they would all belong to the American Federation of Labor and there would be no discussion on the subject.

"Some months ago a committee of men from one of the plants I represent came to me with the complaint that the American Federation of Labor was turning the public against the workingman, and that they felt it was time for the employers of non-union labor to defend them and act as their spokesmen. Knowing that they threw into the bay a walking delegate who had the courage to enter our works to organize them, I sought their reason for their strong opposition to the unions. They were as follows:

"First. They strongly objected to the tyranny and selfishness of the labor union leaders.

"Second. They objected to being put upon the same level of less efficient or more indolent men.

"Third. They were indignant at the strife and hard feeling being stirred up between employer and employe and the general branding of the employer as a scoundrel and discredited person. They knew most employers were once laboring men and they hoped to be themselves or were educating their children to be employers and had no intention of tearing down their goal.

"Fourth. They felt the contact with the employer direct was more satisfactory and brought quicker and better results than through a medium which considered its own ends first and the men second.

"Fifth. That men out of the union got better wages and were much more contented. They looked upon the employer as a friend and leader and enjoyed working with him, instead of begrudging every service, knowing nothing individually counted.

"Mr. Gompers does not want to admit these facts. He found out in the steel strike a majority of workingmen wanted an 'open shop.' He knows that his power has only come from augmenting governmental control by frightening the timid politician with his soap bubble. Mr. Gompers realized some time ago that the majority of workingmen were with their employers and that if they all worked together in political matters the union would be an empty shell. It was for this reason that legislation was constantly directed against the employers to discredit him. Why cannot the politician remember the election between Mr. Bryan and Mr. Taft? Mr. Bryan accepted the plank on labor, of better labor unions, as written by Mr. Mitchell, and the A. F. of L. advocated his election, and yet Mr. Bryan got less votes than he ever received before.

"Put a labor union plank in the platform of either party and the majority of laboring men will vote against that party.

"The majority of workingmen, the majority of employers, the majority of salaried men, the majority of professional men, and, I believe, the majority of union laboring men, if they could speak their minds, believe in an 'open shop,' and all these classes are just as interested in the betterment of mankind as a few men who make a living misrepresenting the laboring man and the country.

"It is quite time that men representing the majority of men in this country who work with their hands and skill come to their defense. Most of the men employed at our works are my personal friends and I represent them when I speak on this subject or vote at the National Chamber of Commerce. If I did not, they would choose Mr. Gompers, by joining the union. They all know I voted for the 'open shop' and they all back it up, as do the employees of the other members who voted the same way."

PEP PARAGRAPHS

Speed is largely concentration.

Doubt never won a fair damsel, nor landed an order.

Spuds grow in the ground, and you have to dig for 'em.

Don't argue with a man you want to get something from.

Don't worry over a loss; pitch in and cover it up with a gain.

Just because a horse starts out well, is no reason for slacking the reins.

It's said that time is money; then for Pete's sake, spend it where it'll buy the most.

It has been said that money is the root of all evil. Don't you believe it; idleness is the root of all evil.

We'd a heap rather be knowed as a good-for-something peddler than as the most popular no-count in the universe.

Percy Verance is a fine chap; he tears a leaf from the lay-book of a barn-yard fowl; that's why he makes good.

Just because some guy says that he'll do a certain thing you want done, is no reason for you to count on it's being done.

Persistence, force, courtesy and common-sense will crack the hardest nut, and there's a lotta satisfaction after the cracking.

(Copyright, 1920, by S. A. Chandler.)

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Cannot Warp

U.S.G. SHEETROCK

Makes Rigid, Warp-Proof Walls

A sheet of pure gypsum rock, encased in a heavy protective covering—tough, rigid and durable—Sheetrock cannot warp, shrink or buckle. This standard wall and ceiling material in unit form is fireproof too. Uniformly and permanently even in surface, it takes any decorative treatment: paper, paint, panels. It resists heat, cold and sound.

And Sheetrock is put up quickly, economically. Made by the special U. S. G. process, it can be sawed and nailed—as readily as lumber. The nailing strength is reinforced by the U. S. G. Patented Reinforcement.

If you are thinking about building a new home, or perhaps just a play room for the children, a spare bed room, an attic room, a laundry, a clothes closet, or a sleeping porch, it will pay you to learn more about Sheetrock. We will gladly provide you with complete information.

SHEETROCK

Sheetrock is ⅜ in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

A Complete Line of Moulding and Studding to be used with Sheetrock

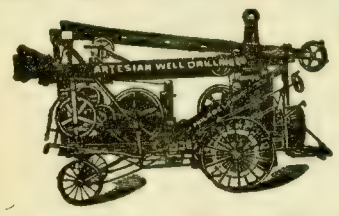
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

DIFFICULTIES ENCOUNTERED IN THE INDUSTRY

Difficulties Encountered in the Industry—Suggested Remedies—Pertinent Reasons for High Costs—Labor Prolems—Future Holds Promise

Address by C. Clay Nims, President of the Ohio State Association of Builders' Exchanges, Before the Meeting of the Ohio State Association of Material Dealers at Cedar Point

In these times of industrial unrest there is need of a better understanding between contractors and material dealers—a more harmonious relationship should exist. Our interests are identical and by adopting mutually satisfactory policies, a well planned progam of distribution for available materials and labor, encouraging classes of buildings and improvements most needed and holding back others that can wait, we can render to the public a larger service, make better balanced communities, provide finer places in which to live and enjoy a much greater measure of satisfaction in the conduct of our business.

The building business in recent years has been established upon a much higher plane, and this has been possible because of associations, similiar in character to yours, where the contactor could meet others in the same line of work and study problems peculiar to their business, profiting by the knowledge of the experience of others. A few years back a contractor was looked upon as an unnecessary expense in the greater part of the building business, and all that he had to sell was his ability to get more work from labor. Today he is a real necessity, performing a distinct service, with mammoth organizations of men, great and varied equipment and machines, large purchasing and expediting power and a recognized factor in industry everywhere.

It is quite apparent that the material men have enjoyed the same, if not a greater, progress than the contractor. The time is past when we can buy our lumber from the saw-mill, our lime and cement from the manufacturer, and all the other materials entering into building construction. No contractor could conduct his business of the required materials were they not assembled in large supply sources where they can be distributed at the minimum cost, and I am inclined to believe that the larger and more centralized these sources become the better and cheaper the materials can be distributed. Another decided advantage in times of low production and shortage is the proper and more equitable distribution of materials. The buildings most needed by the community can be taken care of first and all can be required to curtail so that no favored few stand out conspicuously because their buildings are completed in record time at the expense of others.

While the past few months have been tedious for both material men and contractors, we have met them in a very commendable way. It should give us some encouragement for the period just ahead, which will differ in that we will find ourselves with plenty of material and few orders. Shortage of certain materials—caused largely by failure of transportation facilities—will be the chief reason for the piling up of locally manufactured materials, and such other materials that can be shipped. Even with the freight increase and with the railroad workers satisfied, shipping cannot adjust itself for some time. The railroads do not have the rolling stock, and I believe many more miles of track must be laid before shipping can be carried on in a volume adequate to our needs and doing away with tremendous bonuses. Until this is done, industry cannot greatly improve.

There are quite a number of ills, in addition to the transportation situation, that must be cured before we should expect a return to healthy business, and the sooner we recognize them as real and adjust ourselves in a way that eliminates them, the sooner good business will return. I am going to present a few of these for your consideration and thought, as I think they affect conditions today.

Extravagance.

A tremendous let-down occurred during the war period by everyone, and we did not correct ourselves when the war was over. No one individual or any particular class of men is altogether to blame—all acted under pressure of public sentiment. The responsibility can be passed right on to where it belongs, to the little fellow you always see pictured in between Labor, with its full dinner pail, and Capital, with its large stomach; little old Mr. C. P., which includes every one of us. All of us wanted what we wanted and wanted it when we wanted it, and it seems to me that that pretty nearly sizes up our whole trouble. The high cost of commodities can be traced to this attitude that was so common and so contagious that few escaped. I wonder how many of us have stopped long enough to study the excess costs—purely bonuses—due to wanting things when we wanted them. May I take the time to recite a few examples? I could use all of the time that has been allotted to me in simply giving similar instances that have come under my personal observation. A large manufacturing concern not far from Cleveland, in keeping with the times, decided to distribute its product from Cleveland to New York by motor trucks and procured a fleet of trucks on open contract to make the trip, leaving material at Buffalo, New York, Cumberland, Philadelphia and Pittsburgh, and picking up raw material on the way back to the factory. It cost $21,000, taking twenty-eight days to make the trip. The total cost of rail shipment (and I took

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

the time to check with the rate clerk personally) would have been $960. The total excess bonus cost was just $20,040. Do not take these figures as a fair comparison between truck hauling and railway shipping, as in many instances certain hauling is cheaper by truck. I recite this example to give you some idea of how far astray a policy of get-what-we-want-and-fix-the-price-later may lead us. Think this over and if you find it necessary to call upon your bank for additional funds in the next few weeks you will not feel so badly when your reception is not so courteous as usual. Capital cannot be attracted to help finance waste of this magnitude, and it goes pretty nearly into everything we do under prevailing conditions. Coal at $8.50 per ton, common brick at $30.00 per thousand, cement at $5.50 per barrel, common mill lumber at $85.00 per thousand cannot and will not continue, or if it does our industry must stand still.

In our jobbing department the other day we were in need of three pieces of material, nothing special or complicated about the requirement. Our Superintendent, following his usual custom, called upon Mr. A., of one of our larger concerns. Mr. A. sent him to Mr. B., stating they had installed a new system with added departments and he now was a manager. B. sent him to C., who was the manager of the new department of estimating; C. put down the name on an estimate blank and it went to Mr. D., who filled in the estimate number and passed him along to Mr. E., who listed the material. Mr. F. figured the weights and then sent him to Mr. G., who priced the items and turned him over to Mr. H., who extended and added the amount, but before our superintendent was rewarded for his efforts he was sent back to Mr. D., who filled in the amount opposite the estimate number for record only. It was then ready for the manager, Mr. C., who quoted a price of $260. To follow all this excellent system required one hour and thirty-five minutes, when under the methods in vogue in the good old times the transaction would have been completed in five minutes at most.

There is another great indoor sport that has recently been added to the list of games of chance, namely, stealing men from each other. The great labor turnover is not caused entirely by the workmen. In fact, I think the employer is the greater transgressor, spending millions in advertising and in employing men, coaxing them away from their jobs. The low production of workers today is a direct result of this practice.

I do not blame the material men for the high prices of building materials. You have been the victims of circumstances—willing victims, perhaps, in some instances; and you have passed the excess costs along, adding on a little for yourselves in the process, but, on the whole, you were powerless to stem the tide. Everyone demanded material and, just as soon as they were told it was not available, they would bid up until someone would supply them. The owner demanded his building; we, in turn, demanded the material and secured the labor regardless of price, and work went forward under great hardship, conditions becoming progressively worse until some wise, level heads in the country decided a little breathing spell, giving us time in which to do some serious thinking, would do us all good.

A great many look for lower prices, but this is impossible when we consider the increases in freight, the higher wages, which will not recede to any great extent, and the new plane of living. The base prices will not go down and in some cases may be even higher. A new level of values has been established to stay, but the saving in ultimate cost, after eliminating the extravagant waste and bonuses by putting the industries of our country upon a peace-time basis, will be great—much larger than any of us realize. During the war it was necessary to do many things that increased cost in order to produce to the maximum. I have no criticism to offer for the actions of those in control. We had only one thought—to win the war; but we cannot and must not conduct our business in peace times on a war-time basis.

Unit of Production

Recently we have heard a great deal of talk about the amount of work done in an hour or a day, and it is a very lamentable fact that none of us is willing to put in as many hours of work, or work as hard during the time we are on the job, as was formerly the case. The owner, the manager, or the "boss," as he is often called, likes to swing into place one or two hours later in the morning and close his desk earlier than was his custom of old. Labor is not the only transgressor in this "less amount of production" era. My idea is that a new rule should be established—the "boss" on the job first and superintendents, department managers and other organization men ahead of the workmen. You do or should receive more money and society has a right to expect a greater service of you. If all employers do their part in a whole-hearted, conscientious manner they will remove one of the great obstacles in the way of the worker returning to the moral unit of production.

Closed Shop

The closed union shop must go. It is un-American, holds back the good man and does not make the poor, untrained, inefficient man better. I have no objection to a union if it will secure its membership without coercion, will not limit production and will subscribe to the open shop principle. There is at the present time a strong and growing discontent among themselves. They will not be shackled by the old principle of the strong shall carry the weak, the trained worker shall carry the inefficient, lazy fellow. In other words, workmen are soon going to demand pay based upon the amount of work they do. It is discouraging to note that the most trouble this year in our industry is with unions having one hundred per cent. organizations, with trade contracts agreeing to arbitrate all differences and guaranteeing continuous operation. It clearly demonstrates that labor leaders abuse the power conferred upon them by their organizations and that they will fight if more can be gained by force.

Confidence

I have put confidence last because we must master the others before a return of confidence can be expected. I refer to confidence in an immediate return to normal business. All of us have confidence in this great country of ours. If you are playing it short today, and continue to do so, you will lose, because we are too rich in natural resources, too rich in a great substantial people, too rich in a great government, and in social and educational institutions to ever be submerged or lose. Remember, play this for the biggest, greatest and grandest nation on earth and you will win joy, happiness, content, and your portion of the material rewards that go with it.

—Building Industry.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

As The Editor Sees It

LIME

Address to the Philadelphia Building Supply Association, Philadelphia, October 19, 1920 by Tyrrell B. Shertzer,, Construction Engineer Eastern Bureau of the National Lime Association.

Editor's Note—*The statements made in this address emphasize how little is known of the varied uses and the incomparable advantages of lime. The address is therefore especially timely in the face of the great building era approaching.*

Speed in construction is the watchword of the day; this tendency is justified to a greater or less degree by present conditions. The high cost and decreased efficiency of labor, the present increased cost of materials and high interest rates, all make it desirable to complete a structure at the earliest possible moment in order that the interest and carrying charges may be reduced to the minimum and the structure become revenue producing.

One of the very oldest, and seemingly well known, materials of construction, is lime. It is not possible to trace the oldest uses of lime, as the earliest relics of engineering and architectural structures in existence, contain lime in the form of mortar and plaster, which are of such a quality that they indicate a thorough understanding of this material such as could only have been obtained through many years of use.

Many very ancient ruins have been discovered in which the lime mortars and plasters have resisted the ravages of time during the intervening ages, better than have the structural materials to which they were applied. One example can be cited in the case of the ruins of Pompeii, which was destroyed in A. D. 63, and was known to be a flourishing city in 79 B. C. Excavation of this old city is bringing to light remarkable stucco and fresco work; in several cases it has been found possible to remove great slabs of the plaster and stucco from the structures to which they were applied and transport them great distances for exhibition in museums. These frescoes and stuccoes are described as being rather gaudy, which bears additional testimony to the wonderful preservative and lasting quality of lime plaster, since, were it not a permenant material, the colorings and details would never have been preserved.

Many examples of the wonderful plaster and stucco prepared by the ancient Greeks and Romans in other places, have come down to us in perfect condition.

We can follow the use of lime through the middle ages, citing the fact that the remarkable works of the masters of the brush of that period have been preserved and handed down to us as a result of having been painted directly upon lime plaster. We are, however, chiefly interested in the practical aspects of the use of lime and its present day application and possibilities, so that we will dwell no longer in the past.

While I know that you are all interested in this subject from the construction point of view, I cannot resist the temptation to call your attention to the fact that lime is one of the most widely used materials on earth and that in some form it enters into the manufacture, preparation or growth of practically everything we have, use or wear. For instance, were it not for the lime content of the soil, we would have no healthy plant growth, without lime to act as a flux, we would have no steel nor iron, lime is used to prepare our granulated sugar, and so I might go on and enumerate the considerably more than two hundred separate and distinct uses of lime. Lime

is the chief constituent of bone, without it our skeleton would lack the strength required of it, every human being carries several pounds of lime around in his physical structure. Man should certainly not presume to set his opinions up against those of the Creator, and since the Creator has seen fit to use lime so freely in the construction of his noblest work, namely, man, as well as in his lesser works, mankind can hardly go far astray if they follow this example.

Let us, for a moment, consider the first use to which buildings were put, which use continues to be the most important one even to this day, namely, the construction of the home. A man builds a home primarily for privacy, using the word in its broad sense. This privacy means personal seclusion as well as isolation from other groups or families of people. Individual members of a household are entitled to the privilege of isolating themselves from the other members and to be free from annoyance of hearing diverting or annoying sounds and noises, by having these noises conveyed from room to room by resilient, noise transmitting materials of construction. The home owner is entitled to honest value for the money he invests and to such construction and materials as will assure him of continuous, peaceful occupancy. There is no single item entering into the construction of a home which is as much in evidence, can contribute more to the enjoyment of the home and to which, as a general rule, less consideration is given, than the plastering. Aside from foundation or extensive structural failure, there is nothing which will cause a greater menace to life and limb, or more inconvenience and unhappiness than will a plaster failure. It is true that in dollars and cents the value or cause of the plaster in the average home is a small item, but expressed in terms of comfort, happiness and contentment, its value far exceeds that of any other single item. Mention has been made of the fact that certain structural materials are resilient and sound carrying. This is particularly true of certain classes of plastering materials. Lime plaster, on the other hand, is decidedly sound deadening, the reason for its possessing this property are too technical to go into here in detail.

While the home is built primarily for comfort and enjoyment, the home owner is entitled to the maximum amount of construction for the minimum expenditure consistent with good practice. It has truly been said that "Comparisons are odious" but it is necessary to resort to comparisons sometimes in order to clearly demonstrate a point in question. We are now up against such a proposition, and I am going to make a few comparisons. Plastering work which is entitled to consideration should properly be either two or three coat work, preferably, three coat. A properly slaked lime will carry from three to four parts of sand for the first or scratch coat, and from three to six parts of sand for the second or brown coat. It is as a rule safe to figure on using from ten to twelve bushels of lime and about two tons of sand, for 100 square yards of plaster on seven-eights of an inch grounds. One of the most widely used substitutes for lime in plastering, requires about one ton of neat materials and from 2¼ to 2½ tons of sand to do the same amount of work. It is self evident, which of the two materials is the more economical, considering the sand carrying capacity alone. Lime plaster is much more plastic than its substitutes, so that it is easily possible for an operator to apply about 20% more plaster when made of lime. If the floors are kept broom clean, lime plaster droppings can be taken up, reworked and put on the wall. This is impossible with the substitutes—with them the droppings are not only lost but there is an additional expense in cleaning them up and carting them to the dump. Lime plaster remains plastic and workable for a much longer time than do the substitutes, so that the operator has ample time in which to true and line up his work. There is another great advantage which lime posseses over it's substitutes. Lime mortar is a first class material with which to lay up structural units such as bricks, blocks, etc. One lot of lime can be slaked and aged and the resulting paste used for both mortar and plaster by modifying and altering the sand content only.

It may seem queer that I should appear before a gathering of this kind and present arguments and reasons why a material should be advocated, when the arguments and facts presented show conclusively, for a given piece of work, less of this material is required, and the general cost of the work is less. I submit that these very arguments make for good business practice. For the sake of argument, let us assume that a house of a certain design and of certain materials may be built at the present time for $1,250. Now suppose that by substituting certain other materials of well proven stability and reliability, the cost of a house built according to the same plans can be reduced to $1,000 or 20% less than house number one. Again let us assume that the labor in both houses cost the same percentage of the total cost and assume this as being 50% thus leaving 50% as the cost of the materials, assuming some more, let us say that the Materials Dealer clears 15% net. On house number one he clears $93.75 and on number two $75.00 or 20% less net. This means that he will make exactly the same total profit on four of the number one houses or five of the number two houses. Now let us imagine two adjacent suburban developments. Promoter A builds eight houses according to scheme number one, promoter B builds ten according to scheme number two. The advantages of both developments are identical but promoter B can offer his houses at twenty per cent. less than

(Continued on page 903)

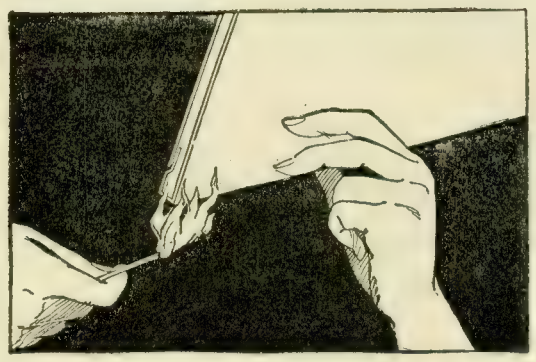
We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It Is Lasting

Sheetrock is a sheet of pure gypsum rock, sheathed in a heavy protective covering. It is the standard wall and ceiling material in unit form—for new construction, alterations and repairs.



Manufactured by the special U. S. G. process and uniformly even in surface, it takes any decorative treatment: paper, paint, panels. Or it may be used in its own attractive finish of soft mist gray.

Sheetrock is fireproof too, and it cannot warp, shrink or buckle. It resists heat, cold and sound, insuring maximum insulation the year 'round.

Beautiful walls and ceilings, safe walls and ceilings, walls and ceilings that insure lasting comfort and economy—that is what Sheetrock means. Come in and inspect Sheetrock yourself, and you will see why we personally endorse its use.

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

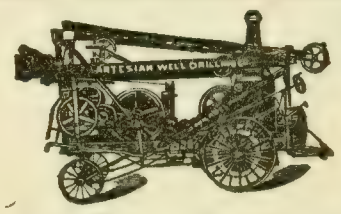
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.



This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

ber 21, 1920. Sealed Proposals will be opened in this office at 3 P. M., November 19, 1920, for alterations, etc., to the United States post office and custom house at Oswego, N. Y. Drawings and specifications may be obtained from the custodian at the building or at this office, at the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 20, 1920. Sealed Proposals will be received separately, for the different materials and for labor by the different trades, and opened in this office at 3 P. M., November 18, 1920, for the construction of the United States Post Office at Athens, Tenn. Materials required will include concrete, reinforcing metal, stone, brick, miscellaneous iron and steel, composition roofing, dampproofing, sheet metal, plastering, interior marble, sanitary slate, lumber, mill work, painting, hardware, plumbing, heating, electric work, etc., in accordance with drawings, specifications, and bills of quantities attached thereto, copies of which may be obtained from the Custodian of the site at Athens, Tenn., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 892)

promoter A, and he offers a better house for less money in the bargain. It does not take a financial genius to see that promoter B will sell his ten houses before promoter A gets a good start and so will have his capital released to start some more houses, and so buy more materials from the dealer who makes another profit due to the quicker turn over of B's money. In the case of individuals building homes it is perfectly safe to say that the ratio of people who can afford to build under scheme number two as compared with those who can afford to build under scheme number one will be much greater than the four to five which represents the relative ratio of costs.

Any legimate method which can be adopted to reduce the cost of construction is an absolute necessity at this time. As soon as proper construction can be started all producers and distributors are going to find themselves hard put to supply the demand, but this demand must first be created by reducing the present high cost of housing. In a tabulated statement it was shown that lime had increased less than any other building material, the increase in cost being but 78%, while the average for all other materials was 108%. When we consider that it requires one ton of coal to burn on an average of about 3 tons of lime, and that this one item of cost, alone, has increased about two hundred per cent., we can readily see that the manufacturers of lime were fully justified in making this modest increase in price.

There are many other uses for lime in and about the home after it has been constructed and incidental to its occupancy. These several uses will not consume very much lime in the individual home but if wide publicity could be given them and the public educated to the proper degree, the aggregate tonnage of lime which could be disposed of for these purposes would be large. Let us take the time to consider a few of these uses. The household heating unit, whether it be a hot air furnace, steam or hot water generator, suffers and deteriorates more during the summer from rusting than from actual use. If the grates and ash compartments are well cleaned in the spring after the fire is stopped and a quantity of lump lime placed on the grates and in the ash compartment, this lime will absorb the dampness and prevent rusting. A few lumps of lime placed around the cellar will free it of dampness and any musty odors. A good coat of whitewash will do more towards making a cellar or closet sweet and sanitary than almost any other thing. Small pieces of lump lime in a dish placed in the refrigerator and renewed at frequent intervals will keep it dry, sweet and clean. A spoonful of slaked lime worked into the soil of potted plants will kept the soil sweet and materially improve the health of the plants.

Let us now consider the value of lime in the heavier types of construction. It has gotten to be quite the fashion for Building Codes and designers, to specify cement mortar for laying up the structural units of large buildings with the idea that the cement mortar is so much stronger than the lime mortar. A couple of years ago, Prof. Maggregor, of Columbia University, conducted a very extensive series of tests to determine the relative values of straight cement mortars as compared with mortars composed of various mixtures of cement and lime. All of the mortars tested were basicly of a one to three mix, that is to say, three parts of sand were used to one part of cementing material. His test specimens were prepared by a practical brick mason and consisted of piers of face brick with the several mortars. These test specimens were aged and tested to destruction during three periods of time, viz.: 7 days, 28 days and 3 months. All specimens at all ages containing up to and including 50% of lime gave higher results than did the specimens laid up in plain cement mortar. At the age of three months, the average value of the specimens containing 50% of lime was 34½% higher than the average value of the plain cement specimens. At this same age the average value of specimens made with a mortar composed of 25% of cement and 75% of lime was but 4% less than the average value of the plain cement specimens. All of the specimens laid up with plain lime mortar gave values far above the loadings allowed by any building code, being about ¾ of a ton per square inch at 7 days and within a small fraction of 1 ton per square inch at 3 months. A check series of tests in which the specimens were laid up with common brick, verified these results.

There is no class of structures in which the mortar is subjected to greater stresses than in tall chimneys and stacks, an examination of the specifications prepared by the companies which specialize in chimney construction will show that as a general rule they call for a mixture of cement and lime in the proportion of one part of cement to two parts of lime. This, in itself, should be sufficient refutation of the fallacy that straight cement should be used in heavy construction work.

Owing to the durability, the pleasing effects which may be obtained and incidentally to the high cost and often unsatisfactory results obtained by other finishes, the plastering of, or as more commonly called stuccoeing, the exteriors of buildings of all kinds is rapidly growing in favor. At the present time, there is a wide divergence of opinion among the architects and engineers as to the proper methods of preparing and applying stucco. A list of the ingredients, prepared from a collection of stucco specifications, would include about everthing which possesses any known cementing value and many, which sad experience has shown, have no cementing value. The methods of preparation and application vary as greatly as the ideas as to how an automobile should be constructed, and runs the entire possible gamut with many impracticable requirements thrown in for good measure. Sight has been lost of the facts that good stucco is dependent upon good workmanship, careful flashing and properly prepared materials of demonstrated durability and integrity. When we consider that stucco made of lime, by the ancients, has resisted the ravages of time during a period of more than twenty centuries, that the fine examples of the same material still in existence on the buildings erected in Europe during Medieval times, or coming closer to home, the many examples to be found on the Colonial buildings of our own coun-

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

try, are all still giving most excellent service, can one doubt that lime stucco is a durable, dependable, structural material. No other material ever used by mankind has successfully passed the severe tests of time, weather and wear, as has lime.

The most recent application of lime to construction is the admixture of hydrated lime to concrete. This is a relatively new application and like most new things, is meeting with some opposition on the part of those who do not appreciate the benefits to be derived and are too self satisfied or engrossed in other matters or interests to give the subject the consideration which is due it. Hydrated lime is one of the most finely divided materials known, this extreme fineness is due entirely to chemical action and not mechanical grinding. When made into a paste with water it becomes the slipperiest, smoothest, and at the same time, the stickiest material used in modern construction. This paste has a remarkable covering capacity and imparts the properties of slipperiness and smoothness to other structural materials with which it comes in contact. You are all familiar with the fact that cement mortar which contains a percentage of lime paste will work much more smoothly, faster and will not crumble or curl as so frequently happens with straight cement mortar. When we add hydrated lime to the other ingredients going to make concrete, we do exactly to the concrete what the lime paste does to mortar, that is, the concrete is made more workable, more plastic and holds together better, the result is that the concrete will flow down chutes easier, will slip from barrows or buggies cleaner, will not unmix, will flow into the forms with less aid and effort, will flow around and lie closer to reinforcement, will work its way into restricted places, will lie closer to the forms themselves, thus making more uniform smoother faces to the finished work. The internal lubrication of the mass, causes the individual particles of sand and coarse aggregate to slide over and around each other more readily and so arrange themselves in a more compact, denser mass. The hydrated lime, being so much finer in texture than any of the other ingredients, slips into and fills up what would otherwise be minute voids within the mass and this, combined with the tendency of the other ingredients to arrange themselves more compactly, makes the entire mass so much more dense that it becomes watertight.

These properties have a direct economic value to the structure and data kept by many contractors and engineers have demonstrated that the cost of the hydrated lime was considerable more than made up by the reduced cost of transporting, placing and finishing the concrete.

One of the liveliest subjects before us today is the matter of improved highways and it has been conclusively proven that in most cases the concrete highway is the best solution of the problem, since concrete resists wear better and is far more durable with less up-keep cost than any other type of construction.

As a result of several years investigation and observation, the State of Delaware has now standardized 1-2-4 concrete with an admixture of hydrated lime for all of its road work. Prior to the adoption of this standard, the mixture of 1-1½-3 concrete was used.

Since sand and gravel or broken stone are available almost anywhere and are the cheapest ingredients of concrete, the fact that more satisfactory results can be obtained with the leaner mixture means that a greater mileage of road can be built for the same amount of money.

The practice of specifying hydrated lime in concrete is growing rapidly among the progressive engineers and architects, and the public regulatory bodies are awakening to the benefits to be derived from the proper use of hydrated lime for this purpose. After several months study and investigation, the Board of Standards and Appeal, which is the court of last resort as far as methods and materials of construction for the City of Greater New York is concerned, passed a rule permitting the use of hydrated lime in concrete. The newly adopted Building Code of the City of Pittsburgh, which was in preparation for several years, permits and suggests the use of hydrated lime. The 1920 edition of the Standard Building Code of the National Board of Fire Underwriters, suggests and permits its use. The City of Baltimore and the Building Departments of many other cities throughout the country permits it. It is unfortunate that the Building Department of your city, continues to prohibit the use of hydrated lime in concrete and restricts the use of lime in mortar to the extent it does. This is particularly unfortunate for the reason that your city is situated adjacent to one of the greatest lime producing sections of the country and a section which produces one of the highest grades of lime known. These restrictions prevent the builders and consumers of this section from taking full advantage of the wonderful gift which nature has placed at your very doors and incidentally prevents the distribution by you gentlemen of a material of known and proven worth.

Were these restrictions removed and full advantage taken of the possibilities of your back yard sources of supply, the lime industry would be greatly encouraged and, as it expanded in response to the increased demand, the industrial wealth of the entire community would be increased. Many communities through the medium of their Boards of Trade or Chambers of Commerce do all within their power to stimulate business in their districts and to induce new industries to establish themselves, since it has been found that such a policy redounds to the benefit of the entire locality. While this argument may seem altruistic, increased production and prosperity in a community is bound to have great individualistic beneficial results also.

Before closing, I would like to make a few remarks about the use and properties of hydrated lime in applications other than concrete mixtures. The larger building operations of the day are, as has been said, conducted with the primary idea of speed in construction, incidentally they are, as a rule, limited as to space available, particularly those in the congested sections of our cities. For these two reasons, materials must of necessity be delivered to the work in such form as to be immediately available for use. Hydrated lime falls in this class of materials. There is no secret as to what hydrated lime is and the manufacturers of it court the fullest investigation of their plants and inspection as to the several steps in its preparation. It is simply thoroughly and completely slaked lime, prepared under carefully regulated factory conditions, freed from all impurities and offered to the consumers in the form of a fluffy white powder put up in conveniently sized packages. Hydrated lime is a self checking material, in that if it is not pure and completely hydrated or slaked, if you prefer that term, it is not possible to keep it in paper bags, and this is the form of package used.

It is possible to mix up mortar or plaster with hydrated lime and use it at once, in just the same manner as portland cement or the substitutes for lime may be used, in the case of plaster though, better results are obtained if the lime is soaked for about 24 hours prior to sanding. The use of hydrated lime in concrete, does not disturb the requirements as to the amounts of any of the other ingredients, since the hydrated lime is an additional ingredient, the proportions of cement, sand and coarse aggregate remaining exactly the same.

As The Editor Sees It

A BRITISH housing expert, now visiting in the United States, to study housing conditions here, has expressed great surprise at the lack of interest shown by the American government in the housing situation. America is, in fact, practically the only country where the Government has not taken steps to solve the housing problem and make possible the erection of the necessary homes for its people. Every day the shortage of homes grows more acute and there is, as yet, no definite action in view to relieve the existing conditions. In a recent issue of the *Bulletin of the Illinois Society of Architects,* Mr. F. E. Davidson, tells what he believes may be done to start building. Mr. Davidson says:

"Any analysis of the statements of those whose experience justifies their expressed opinion of what may be expected in the near future as to the revivial of building may be briefly summarized as follows:

"1. Considering the present shortage in construction, estimated at three and one-half billion dollars in the United States, it will require the best of efforts of the entire construction industry working at maximum capacity for ten years to fill this gap and get back to normal.

"2. No material reduction in either material or labor costs may be hoped for for some time.

"3. Building costs will be slightly lowered just as soon as the transportation systems are able to function normally, for then building materials may be secured as required and the time necessary for the completion of a structure materially shortened as compared to the time required in the immediate past. This shortening of the time of construction will reduce the amount of carrying charges. An increased output of the building mechanics which may be expected, due to a scarcity of work and the consequent competition for jobs, will also, in a small measure, reduce building costs.

"4. Money is still, and for some years will be, the controlling factor. Money will be invested in building securities in direct ratio as the return on the sums invested bears to the return of moneys invested in bonds and other securities.

"5. A vast amount of construction for housing is imperatively needed. Private capital will not invest until rent returns are advanced to yet higher levels, or until real estate securities are made more attractive in other ways.

"6 There are two methods suggested to make real estate securities more attractive to investors:

a. Repeal the income tax.

b. Exempt from all taxation for a period of years, moneys invested in buildings.

"7. The alternative is for the nation, state or municipality to raise money by taxation or bond issues to construct needed housing, letting the financial loss of such a proceeding be borne by the entire community."

* * *

MONEY, or rather the lack of it, seems to be the greatest obstacle in the building game today. In the *Builders' Journal,* C. Stanley Taylor tells us, that a number of builders, failing to get mortgage money locally, are wondering whether it is possible to get mortgage loans from individuals or corporations located outside of their own territory. Generally speaking, it may be said that there is practically no outside mortgage money obtainable. As practically every builder has experienced, mortgage money is at best very difficult to obtain. In some cases, such as in the Detroit district, the allowable rates of interest have been increased and where money is available at all there is usually a bonus payment involved which makes it almost impractical to utilize such funds to advantage.

Just when building loan and permanent mortgage money will "loosen up" it is extremely difficult to predict. Certainly, at the present time so many inducements are offered to the use of capital in other lines that the stable line of building is suffering from lack of financing in a manner never before known when the needs of buildings of every kind was so great.

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.

BLUE PRINTS

A comparative study of building activity shows that where the demand is greatest and rental incomes and sales possibilities are highly developed, building is much more active than at other points. It is plainly evident that some mortgage money is available if a sufficient inducement is offered to the lender; but to be able to make a sufficient inducement there must be a reasonably attractive investment first to the builder or owner who undertakes a new building operation.

In seeking to obtain mortgage money, therefore, the usual procedure must be somewhat reversed, and a builder who is undertaking a new project should (possibly with the assistance of a real estate broker) determine exactly what offer he can make in order to get the necessary building loan. It may be that the rental income or the sales possibility of the operation which he contemplates is such that he can afford to pay unusually high rates or a substantial bonus in order to obtain required mortgage funds. In the case of an investment property it may be that local rentals are so high that it will be possible to set aside a sinking fund to take care of the additional interest fees represented in the cost of financing.

The builders' best method of obtaining money at the present time would seem to be from individuals or from loaning institutions which are not generally in the market to make loans, but which might be induced to make necessary loans if a sufficiently attractive offer for the use of the money can be made. In many instnaces an ordinary loan application will be turned down with the statement that there are no funds available. On the other hand, if accompanying this application it is possible to make an inducement in the way of a bonus offered, much more consideration will be given by loaning institutions.

Certainly, however, it is evident that if in no locality in the country there is sufficient money to meet local building loan demands, it is practically impossible to get money from such sources for use elsewhere. The builder who is working out plans, therefore, hoping to get money from an outside source, is wasting his time, unless he has definite connections or has received encouragement from some particular loaning interest.

In view of the increasing popularity of the co-operative method of financing building construction, it would be much more to the advantage of a builder to develop a project upon this plan, trusting to obtain financing through the contributions of a number of individuals interested in obtaining space in the contemplated building.

This co-operative method of financing the construction of buildings, would seem to be the logical next step in seeking mortgage money, rather than attempt through casual inquiry to find a source of mortgage loans in distant localities. It is true that for highly specialized operations there are national loaning institutions through which applications may be made for financing, but as a general rule, and as already explained, the seeking of outside mortgage loan funds constitutes definitely a waste of time on the part of the average builder.

During the past two years real estate subdivisions have been enjoying phenomenal success in the market of home building sites, particularly on the easy payment plan. It is found, upon analysis, that subdivision activity follows industrial development. Thus in the automobile towns of the Middle West this activity has been at its height. Many real estate dealers have predicted a great falling off of sales during this year, but from average reports it would seem that the public, particularly that percentage of the public represented by industrial employes, is steadily investing.

Real estate subdivision business has been highly developed to a point where attractive home sites are sold for low down payments and on easy weekly or monthly installments. While it is understood that a large percentage of these home building sites will not be built upon for many years, the purchase of sites, together with the known condition of housing shortage in practically every industrial community, offers reassurance to many builders as to the development of sound activity in this field of investment. If it were not for the difficulty of obtaining building loans thousands of homes would be constructed immediately in spite of high costs, because where a housing shortage exists rental increases have been so great that owners of lots would be willing to build at almost any cost if they could be assisted in financing building operations.

Gradually, practical plans for financing home building are being developed in various communities and through these plans it will be possible for the speculative builder to keep his assets liquid and to continue the construction of homes. Certainly the first step in obtaining a home or in causing a home to be built is the purchase of a lot, and following a continued period of activity in home site purchasing there is always a period of activity in home building which extends even into a time when general business conditions are not good.

Many owners of lots are at the present time seeking to meet the housing shortage by building inexpensive shacks, ready-cut houses or garages on lots which they have purchased on easy payment plans, contemplating living in such buildings until they are in a position to build permanent homes. Wise builders are taking advantage of this state of the public mind by developing practical plans for houses which can be constructed one unit at a time and for the construction of garages which can be made habitable until such time as the owner is in a position to build his home. The construction of shacks or very inexpensive houses on

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Barrett Specification Roofs

Bonded for 20 and 10 Years

Nashville Believes in Bonded Roofs—

NASHVILLE, Tennessee, "The Athens of the South"—the home of Andrew Jackson, Sam Houston and James K. Polk—is imbued with the spirit of progress, and is a leader in building construction and civic advance.

And most of the city's prominent new buildings—a few of which are pictured—are covered with Barrett Specification Roofs. For the property-owners and architects of Nashville, like those in all other thriving American cities, are strong believers in these famous roofs backed with a Surety Bond.

The Surety Bond Guarantee

The Barrett Company is the only Company that has enough confidence in its roof to put back of it a Surety Bond. In fact, no other concern will guarantee a roof for so long a period, much less furnish a Surety Bond.

The Surety Bond is offered on all Barrett Specification Roofs of fifty squares or more in all cities of 25,000, or over, *and in smaller places where our Inspection Service is available.* It is issued by the U. S. Fidelity & Guaranty Company of Baltimore, and exempts the owner from all maintenance expense for the life of the Bond.

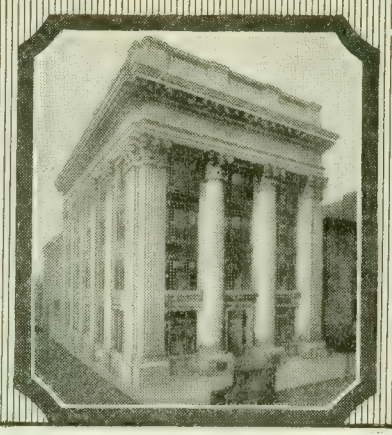
Our only stipulations are that The Barrett Specification *revised April 15, 1920,* shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection.

These roofs take the base rate of insurance and cost less per year of service than any other type of "permanent" roof.

Important Notice

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can name many roofs of this type that have been in service over forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof bonded for 10 years. Both roofs are built of the same high-grade materials, the only difference being in the quantity used.



Full details regarding these Bonded Roofs and copies of The Barrett Specification sent free on request.

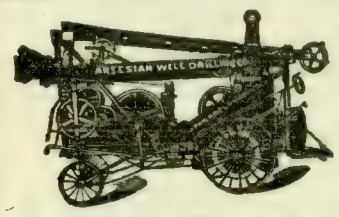
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

It Cannot Warp

U.S.G. SHEETROCK

Makes Rigid, Warp-Proof Walls

A sheet of pure gypsum rock, encased in a heavy protective covering—tough, rigid and durable—Sheetrock cannot warp, shrink or buckle. This standard wall and ceiling material in unit form is fireproof too. Uniformly and permanently even in surface, it takes any decorative treatment: paper, paint, panels. It resists heat, cold and sound.

And Sheetrock is put up quickly, economically. Made by the special U. S. G. process, it can be sawed and nailed—as readily as lumber. The nailing strength is reinforced by the U. S. G. Patented Reinforcement.

If you are thinking about building a new home, or perhaps just a play room for the children, a spare bed room, an attic room, a laundry, a clothes closet, or a sleeping porch, it will pay you to learn more about Sheetrock. We will gladly provide you with complete information.

SHEETROCK

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

A Complete Line of Moulding and Studding to be used with Sheetrock

Proposals

INVITATIONS FOR PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., Oct. 25, 1920. Sealed Proposals will be opened in this office at 3 P. M., Sovember 16, 1920, for new mezzanine floors, etc., in the United States Post Office building at Allentown, Pa. Drawings and specifications may be obtained from the Custodian of the building or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 20, 1920. Sealed Proposals will be received separately, for the different materials and for labor by the different trades, and opened in this office at 3 P. M., November 18, 1920, for the construction of the United States Post Office at Athens, Tenn. Materials required will include concrete, reinforcing metal, stone, brick, miscellaneous iron and steel, composition roofing, dampproofing, sheet metal, plastering, interior marble, sanitary slate, lumber, mill work, painting, hardware, plumbing, heating, electric work, etc., in accordance with drawings, specifications, and bills of quantities attached thereto, copies of which may be obtained from the Custodian of the site at Athens, Tenn., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 908)

these lots is definitely a waste and every builder should be alert to encourage the construction of a building which will have value in years to come rather than one which must be abandoned before many years.

In many industrial towns signs of real estate activity may be seen on every hand, and on many subdivisions where restrictions are not too drastic small shacks will be seen under construction where it would be far more advisable to expend the same amount of money in building a small unit of a future house, or in building a garage which will ultimately be used for such purpose when the home is constructed. The use of a garage for a temprary home is increasing not only among industrial employes, but among persons who normally could afford much better living conditions. Instances are not uncommon where two and three-car garages are constructed for use as comfortable living quarters to be occupied by the family until such time as building and mortgage money conditions are more favorable to building permanent homes.

Transportation for building materials may be had where buildings are against an emergency. Dr. J. T. Duryea, chairman of the joint committee of railroad and construction industry representatives, formed at the suggestion of the Calder committee, has issued the following:

Any construction work of a nature essential to public welfare, such as houses, schools, hospitals, etc., which cannot be completed because of inability to secure transportation for building materials from various points, may be relieved by reporting the full facts to the joint committee. A description of the project should be made, together with statement of point of origin, shipper and kind of materials to be transported. The committee will then take the question up with the carriers and expedite delivery. It should be understood that recourse to the joint committee should be had only when the ordinary routine of railroad business has failed to accomplish the desired results

and the railroads plead inability to furnish equipment.

This joint committee has offices at 29 West 39th Street, Room 1605, New York City.

A wire from John F. Walsh, chairman of the transportation committee of the National Association of Builders' Exchanges, says that present conditions are encouraging in that railroad officials, when shown the emergency character of a project, are doing their best to furnish such transportation facilities as will meet the builders' needs. Where local railroad representatives do not get action an appeal to the joint committee mentioned above, or directly to the Calder committee in New York, is a sure way of getting action.—*American Contractor.*

PRIVATE ALARM SYSTEMS

BY F. A. RAYMOND

During the past years private alarm systems have become an important and valuable feature of fire protection. The first factory alarm systems were mechanical or electrical devices connected to automatic sprinkler systems to give notice of a water flow, and presumably of fire. These were often connected only to a gong on the outside of the protected building, or to a bell in the office or nearby residence of an employer. When paid firemen were appointed the circuits were extended and these bells were installed in the nearest fire stations.

Somewhat later, about 1880 to 1885, various types of automatic or thermostatic alarms were introduced, which were operated by heat in the same manner as a sprinkler head. These exhibited numerous defects and were mainly operated on open electrical circuits; they caused so many false alarms and were so often out of order as to become largely discredited and were little used outside of the larger cities. In recent years improved types of thermostats have been developed, which are reliable; their use is now increasing.

The next development was the combination watch and fire alarm service now generally available in the larger cities and many others of over 50,000. This is usually maintained by the American District Telegraph Company or its subsidiaries, since they have a messenger service and central telegraph offices as a nucleus on which to build. This system has been found valuable to "watch the watchman" and to provide him, or the occupants at such hours as the plant is in operation, with a convenient and reliable means of transmitting fire alarms. It is especially valuable in assuring owners that the watchman will indeed be on duty and able to discover fires in the incipient stage, during those hours, when otherwise they would gain headway and get beyond control before the fire department would be called.

SPRINKLER ALARMS

In conjunction with the fire and watch service it was found desirable to institute more reliable sprinkler alarm service; this has been developed into a complete and reliable system, which gives distinctive signals for water flows and for the various troubles incident to the operation of automatic sprinklers, such as high and low water in tanks, high or low pressure in pressure tanks or dry pipes, high or low temperature in tanks, leaks, and closing or opening of gate valves. On account of the expense of maintainance of the central station, this system is only installed where a number of sprinkler equipments or a night watch and a fire alarm service in connection produce sufficient revenue to make it commercially practicable.

Loss of life in factory fires in recent years showed that something more was needed than the sending in of alarms to the fire department, so in 1916 the New York State Department of Labor, followed in 1917 by New Jersey, issued requirements for alarm systems in factories. These systems are designed primarily to alarm the occupants of factories promptly upon the discovery of fires in any part of the establishment and to give them a chance to escape before the fire gains headway. The field opened to manufacturers through the operations of these laws has given a great impetus to the fire alarm art as regards interior alarm systems and numerous improvements have resulted.

It is possible now to purchase reliable interior fire alarm devices and systems and also to secure reliable maintenance. It has been found that good maintenance is just as necessary as good material and proper original installations.

For buildings equipped with automatic sprinklers, the sprinkler supervisory and valve alarm service is best adapted. There will be manual fire alarm boxes in connection with such systems, so that alarms may be transmitted at once if discovered before the sprinkler operates.

THERMOSTATIC SYSTEMS FOR MILLS

For buildings such as warehouses, grain mills, storages, or any place where rooms may be unoccupied at times, as in hotels, thermostatic alarm systems are desirable. These are of greatest advantage in non-sprinklered buildings, since the sprinklers themselves are thermostatic alarms.

Manual fire alarm boxes are installed in connection with these systems also.

For buildings where night watchmen are employed, the combined night watch and fire alarm signal systems are desirable. These are much better than the watchman's clocks, since to give approximate equivalent fire alarm service with the clocks there must be an interior alarm system also, but even the watchmen are not under constant supervision. Over Sundays and holidays there may be an intervals of forty-two to sixty-six hours during which there is no check upon the action of the watchmen.

It is generally recognized that the most satisfactory method of operating these interior fire alarm systems is through an approved central station, with direct connection to the fire department or fire alarm headquarters and to the salvage corps. In some cases this central station may be operated by the protected establishment or by a group of establishments or may be operated by the municipality in conjunction with the public fire alarm service, but generally it is operated by a company whose attention is given solely to good operation and maintenance.

In buildings where it is necessary to warn the occupants, so they may escape, in addition to the means of transmission to the fire department, there must be local sounding devices. These buildings include factories, hotels, department stores, hospitals, and similar institutions. Ingenious devices have now been perfected for accomplishing all of the various functions above described.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

The "Builders' Guide" is in its thirty-fifth year of continuous publication.

As The Editor Sees It

THE housing problem in America, today, has been so much discussed that it would seem impossible to say anything new on the subject. At a recent meeting of the National Organization of Commercial Organization Secretaries, however, F. Roger Miller, General Secretary, Chamber of Commerce, Macon, Ga., presented some new phases of the housing problem and drew some interesting and thought stirring conclusions regarding the situation. Mr. Miller began his address with the same words with which we began our editorial of last week.

"The United States is the only great nation of the civilized world that has ignored housing as a national problem. Today, he continued, we are paying the penalty for neglect in a famine of homes and in resulting economic disorders that threaten the life of the Republic.

The condition is not an outcome of the World War, as many have been led to believe, but has been steadily developing for years. It dates back to the time when we forgot the ideals of our forefathers, and departed from the fundamentals upon which the Nation was established.

We entered the war to "make the world safe for democracy." Today, after two years of peace, we find ourselves confronted with the problem of making democracy safe for Americans.

After untold waste of time, money and effort, we are beginning to see that housing affects not only the progress, but the welfare of our Nation, and that its solution demands the best thought and effort of which all the constructive forces of America are capable. After years of intensive industrial promotion, we are beginning to realize that unassimilated industries are community liabilities that lead to civic bankruptcy.

Fifty years ago an average of 101 families occupied one hundred homes. Thirty years ago the average was 110 families, and ten years ago 115 families. Today the ratio is 124 families for every one hundred dwellings.

The urban population of the United States in 1910 was 46 per cent. of the whole and its rate of increase three times that of the rural population. The 1920 census shows over 50 per cent. of our population living in urban communities and more than one-fifth of the total population is concentrated in thirty-three metropolitan areas.

Only 20,000 new houses were built in 1918. Twenty times the number were needed. In 1919 only seventy thousand new dwellings were erected. Meanwhile weddings continued at the rate of 1,040,000 a year, and the demand for homes exceeded by far the supply available and in prospect.

Building costs have increased from eighty to a hundred and fifty per cent., varying in different localities. Enormous deficits have accumulated in the production of brick, lumber and cement. Tranportation costs have increased by more than 35 per cent. and one-fourth of the annual tonnage is building material. We consume lumber three times as fast as we produce it, and in less than fifty years our lumber shortage will become a lumber famine. Meanwhile, our deficit in building has grown 140 per cent. in seven years.

Today, with numerous local housing projects under way, we are still falling farther and farther behind in the national program. Our normal increase in demand this year calls for the construction of 1,250,000 dwellings, and if this number were provided, the shortage which became acute two years ago would remain unsupplied. A net return to the pre-war average of 115 families per 100 homes would require the erection of 3,340,000.

The percentage of home ownership in the United States has been steadily declining for more than fifty years. Of all the homes in America in 1890, 48 per cent. were owned. Ten years later the percentage was 46; in 1910 the percentage was 45. The most conservative estimate available places the percentage for 1920 at 42, which, if correct, indicates a greater reduction than has been recorded for any previous decade. There is an impression in some quarters that the decrease in home ownership has been re-

DRAWING MATERIALS

BLUE PRINTS

stricted to the cities and towns. This theory, however, is not supported by facts. In 1890, 66 per cent. of our rural population owned homes; in 1900 the percentage was 64; in 1910 the percentage was 62 and the estimate for 1920 is 59 per cent.

Out of every one hundred Americans, sixty are discontented. Three widely separated and independent authorities have set this figure at the ratio of unrest in the United States in amazing and significant statements, simultaneously issued. None have consulted the other in arriving at this conclusion.

Says the Military: Sixty per cent. of the American people may be classed as Forces of Disorder or Forces of Discontent. Lashed by unrest, nursing grievances vague and half understood or bitterly real, and Forces of Disorder, reinforced by the drifting Forces of Discontent are whispering revolution and the overthrow of the Government.

Says a most eminent statistician: Sixty per cent. of our population may be classified as galley slaves rankling under the burden of drudgery borne without apparent reward or progress, resentful, sullen, almost hopeless!

Says the Church: Sixty per cent. of all America may be conservatively reckoned as lacking in religion and the qualities that make for higher citizenship.

To the thinker—and every man is become a thinker in these solemn times—There is startling coincidentalism in these figures.

What is the matter with the sixty per cent?

What do more than half of the people of the United States lack which is so vital that the absence of it causes them to drift into the evil influence of Disorder and Discontent? What is this desire which is so keen that the urge of it is coloring the land red with the threat of revolution? Do the sixty per cent. themselves know what they want?

Is there anything pertinent for the thinkers of America in the fact that sixty per cent. of the population of this country do not own their own homes? That the ratio of our people who drift from shack to shack, from cheap cottage to dismal flat, without anchorage, without ties in the community or responsibility of property—is sixty per cent?

We are no longer a nation of home owners. We are become a generation of drifters, renters, floaters—sixty per cent of us! Six out of every ten uprooted from the soil, having no claim upon the land, rattle about loosely, a prey to every wandering wind. And then we ask, what is the matter with the country!

Later in the Southern colony of Georgia there was much discontent. And here, too, the core of the question lay in the ownership of land. No man was permitted to own more than fifty acres of land and this he could not sell or rent or divide among his children. There was no inducement for the improvement of property, no community responsibility; and this was in 1735. In Pennsylvania and New Jersey—most swiftly populated of the colonies—the people were attracted by the fact that in these territories, in 1685, "even a poor man could have a farm of his own." Yet the census of 1910 showed that more than sixty-five per cent. of the homes in those states were rented.

The old pilgrims were wiser than that. After those bitter winters at Plymouth colony, when the bleak Massachusetts hills were sown with frozen graves, when mutiny and discontent soured the hopeful hearts of the people, the old historian records that "in 1624 each family received a small allotment of land for its own. And after that there was plenty to eat in Plymouth!" Plenty to eat and peace in Plymouth because each family owned its own home.

The decade from 1910 shows the greatest decrease in home ownership. Also that period records the keenest restlessness, the bitterest discontent, the boldest and most flagrant defiance of authority of any period of our national life. Are we arriving at the source of the sore which embitters the blood of the sixty per cent. when we prove by Uncle Sam's dry statistics that the greater portion of these malcontents own nothing, hold nothing, have no roots in the ground, no anchorage in their community — no homes? It begins to look that way.

The unrest that is shaking the country like a sickening sort of ague has been patly named "industrial" and the term sticks as pat terms are apt to do. Yet it is actually no more industrial than commercial, no more commercial than professional—or agricultural. Men who are studying the situation deeply are beginning to argue that it is fundamental —that it is a blight eating to the core, its arid decay destroying continually more and more of the precious tissue of our independence. And what are the fundamental things? What are the pillars upon which the wise old fathers of Plymouth and St. Augustine and Fort Dearborn built this land?

Home first! And after that Liberty and Opportunity, and Religion. Reformers have consumed reams of priceless white paper haranguing the multitudes concerning American liberties and opportunities and upon religion; but the nation we have built is a four-cornered creation—and the chief corner, the Home. is more than sixty per cent. gone. No wonder it topples. Any four-square thing will topple when you compel it to stand upon three legs.

There are many sincere and serious persons who will question the relative application of my figures. They will argue that because sixty per cent. of the people live in property which they do not own, it does not follow that that sixty per cent. constitute the ratio of discontent in the United States. And they will point, in confirmation of the argu-

(Continued on Page 935.)

Barrett Everlastic Roofings

Group of buildings on a model farm, located in Connecticut. Illustration shows the house roofed with Everlastic Multi-Shingles and the other buildings with Everlastic "Rubber" Roofing.

Roofings that serve You and Your Client—

WHETHER you are building for resale or for a client, Barrett Everlastic Roofings serve the interests of all concerned—

Yours—because they enable you to keep the cost down, make a substantial profit, and at the same time produce a finished job that will prove an effective advertisement for you.

Your client's—because Barrett Everlastic Roofings are as durable as they are beautiful, giving years of service and satisfaction.

All the 60 years' roofing experience of The Barrett Company is back of Barrett Everlastic Roofings. Made in four styles, as described at right.

Everlastic Multi-Shingles. The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Single Shingles. Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8x12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing. The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing. This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

It Cannot Warp

U.S.G. SHEETROCK

Makes Rigid, Warp-Proof Walls

A sheet of pure gypsum rock, encased in a heavy protective covering—tough, rigid and durable—Sheetrock cannot warp, shrink or buckle. This standard wall and ceiling material in unit form is fireproof too. Uniformly and permanently even in surface, it takes any decorative treatment: paper, paint, panels. It resists heat, cold and sound.

And Sheetrock is put up quickly, economically. Made by the special U. S. G. process, it can be sawed and nailed—as readily as lumber. The nailing strength is reinforced by the U. S. G. Patented Reinforcement.

If you are thinking about building a new home, or perhaps just a play room for the children, a spare bed room, an attic room, a laundry, a clothes closet, or a sleeping porch, it will pay you to learn more about Sheetrock. We will gladly provide you with complete information.

SHEETROCK

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

A Complete Line of Moulding and Studding to be used with Sheetrock

Stang & Mitchell, Real Estate Trust Building, Philadelphia, are figuring.

(Continued from Page 924.)

ment, to the thousands of excellent citizens, merchants, professors, clergymen, who occupy rented property and who are ostensibly living the lives of patriotic and exemplary Americans upon the land which they do not own.

This is undoubtedly all true. There can be no sweeping generalities—no painting of a whole people with one broad and democratic brush. I am making no attempt to prove that every one of the sixty per cent. who does not own his home is to be classed either with the Forces of Disorder or the Forces of Discontent. But I do contend that were the aligned forces of the discontented, the drifting, the sullen, the resentful nursers of grievances, and the rabid revolutionists of this country ranked and arrayed for review, few home owners would be found in those ranks.

Home owners do not go about with torch and bomb, bent upon destruction. Give the most illiterate foreigner a bit of land of his own, however pitifully small it may be, and a threshold to defend and the violent hootings of radicalism will drift past his ears unheeded. He owns something. The town is his town because he owns a piece of it. Whatever threatens the community threatens his property. Men who have roofs of their own do not go about scattering firebrands.

Of the forty per cent. of Americans who do own their own homes, not one has yet been classed with the malcontents. Home owners as a class are universally considered to be thrifty, law abiding, religious, public spirited, good workmen, desirable citizens. There are men who will argue that the flagrantly undesirable could hardly be so fundamentally altered as to become desirable citizens merely through the ownership of property. It is a hopeful sign, however, that the utterly undesirable constitute but a minority of the percentage of the restless. The Forces of Disorder may be past salvaging; but what of the Forces of Discontent—most of whom the eminent statistician christens with the dreary name of "galley slaves" working out their drab days for small compensation? What of the simple hearted children of the old world who have been lured to this country by the extravagant advertising of unscrupulous agencies, promising a "home of your own in America, freedom and prosperity?" These offer a fertile field for the agitator who finds small difficulty in persuading them that they have been cheated and misled. What of the young men who must battle conditions a hundred times more strenuous than those which confronted their fathers?

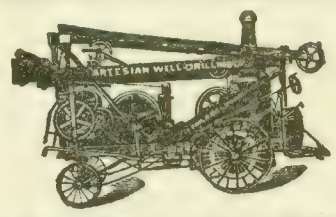
What of the children? Here comes Uncle Sam again with his columns of irrefutable figures, to prove that the death rate in children is lowest in the homes owned by the parents. In rented homes of the lowest class the death rate of infants averages two hundred and eleven per thousand. In homes owned by the parents this rate is reduced to eighty-six per thousand.

And what of the future of the seven hundred and eighty-nine who survive? Psychologists aver that regardless of origin and environment, every individual possesses some measure of criminal tendency. The youth who grows up in the discouraged and sullen atmosphere of discontent, who gets little out of life save hard knocks, is already predisposed

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

to criminality and an easy victim for temptation.

What of the women? The home-making instinct is probably the most persistent attribute of woman. Long after the mating passion has burned itself out and the maternal instinct has died—lingeringly, usually and with recurring pangs—the homing instinct stubbornly endures. Only a woman who dares not tack a picture upon the wall of a rented house, or dig a posy bed in a piece of ground that belongs to someone else can understand the desolation of the homeless. There are women in the Forces of Disorder. Emma Goldman is a woman. There are millions of women in the dreary Army of Discontent.

The Government is depending upon the loyalty of the contented, prosperous, thrifty, forty per cent.—upon the home owners of America. The intiative of the sucecssful classes, the contented classes, must somehow bridge the chasm which separates them from the army of the drifting and discouraged. Give the homeless man an opportunity to acquire a home. No propaganda will be needed to arouse the desire in the hearts of the sixty per cent. The home instinct dies hard. It is as old as the earth, as old as discontent, as old as pain.. Discouragement has drugged it. Despair has beaten it to the ground. The poison of harbored grievances has stupefied it; but let hope shine upon it but for a little while and except for the occasional cases where actual degradation has occurred, you will have a little plant thrushing out eager tentacles—seeking friendly air and rains and the depths of the sane and homely earth in which to root.

It should be possible for every man and woman in America to own a home. It is not now. The day of cheap land, government grants and boom sales is over. So is the halcyon time, famous in literature, when the deserving young mechanic, blessed with good health and fifty dollars in money could acquire a title to the dilapidated mansion on the outskirts of the village and thence proceed to prosper amazingly by sheer power of his stubborn optimism and thrift.

There is little value in making bacteriological surveys to discover where the ailing sixty per cent. contracted the malady which is making Uncle Sam the sick man of the Western World. What the country needs now and quickly is the remedy. Many men of vision are already seeing this, striving in their individual and personal ways to assuage the feverish sore. It is a significant fact that the great industrial centers suffering least from strikes and riots and credited today with greatest efficiency in production are under the direction of men who have already recognized this human element, this fundamental hunger, and have provided the opportunity for every man to earn a home of his own.

Cities and communities are studying the problem and it is here that the hope lies. The situation which is national in scope and which can be partially ameliorated by the efforts of corporations and individuals, must nevertheless be handled--finally as a community problem. The initiative of the forty per cent. in every community must provide the organization and financial foundation for some sort of housing corporation which shall have for its chief purpose the development and sale of permanent homes on terms elastic enough to fit the emergency.

These housing projects will not be profit returning. Six per cent. at best is the most an investor can hope to realize from any community development of this character, and six per cent. is no longer considered a profit. The man who devotes his capital to the community housing corporation must be moved by the same altruism which prompted the purchase of Liberty bonds or bought flour for salvation army doughboys.

The sore which festers upon the national body—the throbbing sore of radicalism and unrest—is as much a cancer to civilization as was Prussianism. There must be no selfishness or stint when it comes to the application of the prescription.

The community housing corporation is undoubtedly the biggest thing for the American of the next decade to accomplish. It is the thing under the right hand of every citizen, every business man—the poignantly needed thing. Though hundreds of Chambers of Commerce and other agencies have studied the question during the past year, these organizations have been so handicapped by inadequate laws, reconstruction conflicts, problems of finance and labor and the general apathy of the forty per cent. that the plans and details for the formation of these corporations upon a permanent basis are still vague. Many plans have been subjected to preliminary tests and discarded. A few salient features of all the experimental mass remains.

The first of these is that the problem of housing the "sixty per cent." must be placed upon a community basis organized, financed and operated by the initiative of the "forty per cent."

Second, the community housing corporation must have for its chief purpose the development and sale of permanent homes, and discard entirely the idea of providing temporary relief for a pressing emergency.

Third, community housing must be so conducted as to provide every possible advantage in quantity buying and production, location of development sites, and schemes of beautification.

Fourth, the dominant idea always must be to provide the opprtunity for every industrious man to buy a permanent home and pay for it on terms that will fit his income.

Fifth, no community can safely undertake a housing project of importance without first analyzing local conditions and attempting at least, to visualize the possibilities of future development.

Sixth, Federal and State agencies are needed to correlate the activities and community organizations to gather and disseminate information, and to provide expert advisory service.

Seventh, speedy enactment of bills now before Congress and of additional legislation designed to provide federal aid for home building, to relieve burdens of taxation upon real estate mortgages, and to establish upon an efficient basic governmental facilities for promoting home building and home owning.

Eighth, speedy enactment by state legislatures of laws supplementing the federal laws, and the abolishment of pernicius state laws which have already made it difficult to interest private investors in schemes of housing development.

Ninth, the general adoption of definite community plans, modern housing codes, and state and municipal laws designed to eliminate undesirable housing, "shack villages," crowded tenements and other breeding places for disease, crime, ignorance, and conflagration.

Tenth, the development of similar plans for promoting home ownership on the farm and the betterment of rural life.

The Home is the Heart of America, Love of Country begins with love of Home. Hearthstones are the altars of patriotism. No industry can produce with efficiency, no community can exist in harmony, no nation will continue in democracy, unless the people have proper homes.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

As The Editor Sees It

THE statements made by William H. Ball, of the Philadelphia Real Estate Board, regarding the housing situation in this city, have called forth strenuous protests from all sides. Surely one need only refer to personal experience, or to the experience of friends and neighbors, to realize that there is a housing shortage. With people compelled to buy houses or get out of them, with others searching in vain for a house or apartment to rent, with people on every hand willing, in their desperation, to pay any price for accomodations, it seems absurd to dare to assert that the housing facilities here are about normal. As J. N. McGarvey puts it:

"Mr. Ball apparently thinks we are all hypnotized. The Sheriff must be hypnotized into believing that hundreds of eviction writs are being taken out for service at his office in the mad scramble of families to displace one another and find shelter over the winter. The poor men and women who have tramped Philadelphia's streets for days and weeks in search of a vacant dwelling in which it would be possible to make a home must also be hypnotized. And I guess the people who are advertising premiums to anyone who will inform them of houses for rent are out of their heads altogether.

"I do not see how Mr. Ball can reconcile his latest fantastic statement with the declaration he made a few months ago that the 'housing shortage in Philadelphia is at least 15,000 units.' He made that statement in a signed article in the Philadelphia Real Estate Board's monthly magazine.

"As a practical builder and an official of the Operative Builders' Association, I know that Philadelphia is suffering from a shortage of no less than 25,000 houses at the present time. We used to build 7,500 houses a year to take care of our normal increase in population. In 1916, our banner building year, we put up 11,000 houses.

"Imagine how that compares with the 1919 building record in this city of about 1,000 houses and this year's record of about 2,000. Have the number of marriages become less since 1912 and 1915 or have thousands of persons decamped and made Philadelphia a sort of 'deserted village,' as Mr. Ball's statistics would lead us to believe?

POLICE FOUND 2,400 EMPTY HOUSES

"The facts are that Mayor Moore had a survey made by the police recently to show how many houses were vacant in the city. A total of 2,400 were discovered. Some of these were being held by speculators for sale. A large number were unsuited for occupancy by small families. Among these are many immense houses in the older part of the city, where wealthy families lived. It is too expensive to transform these buildings into apartments now and they lie idle, as no man of moderate income could successfully undertake their maintenance. But even if these housese were all occupied, it would provide no appreciable relief. The number of houses is being reduced, too, by the destruction of seventy-eight houses in the Tenth and Lombard streets block, where many negro families lived. These people must be accommodated somewhere. Houses also are being demolished in other sections.

"When a young couple get married their greatest ambition usually is to make a home of their own. Often they have saved a few hundred dollars for just that purpose. How many of them can find dwellings in which to set up these decent, modern American homes that are so necessary to the welfare of our Nation?

Comenting on the argument with Mr. Ball, during which the latter made his startling statement, Mr. John Ihlder said:

"I have nothing further to say directly bearing on my argument with Mr. Ball," said Mr. Ihlder, "except that I still doubt my ears when I remember the statement indicating our housing shortage was not borne out by facts.

"If we are all mistaken, and there is no housing shortage in Philadelphia after all, I have a modest request to make for twenty small sanitary houses to rent for $25 a month each which I

DRAWING MATERIALS

BLUE PRINTS

have been endeavoring to locate with all the facilities at the disposal of the Housing Association. I have been unable to find them and would like to get somebody who could do so. These houses are necessary to provide shelter for families of small means in this city who are in desperate condition for lack of places to go. Their cases have been referred to this association through various civic agencies."

Opinion among experts now seems to favor some form of tax exemption for new buildings in order to encourage and stimulate the necessary building. Regarding this, Mr. Ihlder says:

"Discussion here seems to favor a fifteen-year exemption. The danger in exemption without regulations is that cheap, bad construction, which would not last, might be foisted on the community by unscrupulous persons. Someone should pass on the buildings presented from exemption. In England, where such a law is in force, a department has been established to pass on the plans, and multiple dwellings such as tenements and apartments are not permitted to go free. We ought to have the same thing here if the system is adopted. Questions must be answered to show whether the house is well and permanently constructed, provided with sufficient light and air space and sanitary accommodations.

"There has been some talk about the inequity of a tax exemption on new buildings, but the facts are that old houses pay taxes anyhow now and a few thousand new houses in Philadelphia would add only slightly to the total cost of our municipal service. The city might be expected to benefit on the whole through relief from congestion and by the stabilization of values. In New York, the exemption is a right which may or may not be exercised by the city government and for that reason is capable of being withdrawn or enforced as the citizens or their officials deem fit."

THE difficulty of financing home building at present is one great factor in the slow progress being made to meet the shortage of homes, but there are many people who are waiting, —even though the money is available— in the belief that prices must come down. As to this, there are varied opinions, all from equally reliable sources.

Is it, then, in line with ordinary business sense, asks the *American Contractor*, to undertake the building now, when, at best, the situation is uncertain?

If only the UNCERTAINTIES were present the answer would be, no, continues the *Contractor*. But there are present some CERTAINTIES of which we do not hear so much. One such certainty is high rent, bound to continue until the housing shortage has been wiped out. How long will that be? No person purporting to be familiar with conditions throughout the country will seriously submit that we shall be back to normal in house and housing facilities in another five years. We have been talking much about the housing shortage incident to the war and in most minds is the thought that our trouble in this field has to do only with a deficiency which developed while we were so busy fighting we had no time to build.

THE FACTS ARE THAT THE HOUSING AND HOME BUILDING IN THE UNITED STATES, SINCE THE ARMISTICE WAS SIGNED, HAS PROVIDED NO MORE FACILITIES THAN ENOUGH TO REPLACE THE WASTAGE. We have burned down, lost by wind, by deterioration, by condemnation, by accident and by natural wear houses and housing facilities which approximate the facilities we have constructed. We have not met the normal current demand from day to day, to say nothing of catching up on the deficiency incident to the war years.

Rents were last to go up and they will be last to come down in spite of the best efforts of legislators, rent commissions and popular dissatisfaction. Let the prospective home builder contemplate five more years of extremely high rents when he attempts to get the answer on the soundness of now building a home.

Would the average home owner be willing to pay $1,400 for a $5,000 property? In Chicago four and five-room flats which, before the war, rented for $35 now range from $60 to $75. Five years from now the renter will have paid the landlord $3,600 for one of those $60 apartments and have nothing to show but a bunch of rent receipts. The same renter could build a home NOW for $5,000 and five years from now, instead of rent receipts, he would have a $3,600 equity in his home. By paying $1,400 more than he would pay in rent he would have a $5,000 property. By paying only rent he gets rent receipts and the privilege of paying more rent. Does business prudence recommend the possession of rent receipts or $5,000 worth of real property?

Of course the problem is not as simple as it is represented in the foregoing; it is complicated by taxes, insurance, etc., but there is a simple business problem in home buying and it is whether, in the long swing, it is better to pay rent and have nothing, or pay a sum not materially more than rent and have property which is bound to be worth more and a great deal more than the difference between the rent paid and the actual cost to the home property.

It is impossible for the writer to convince himself that construction costs are going to drop appreciably for many years. But granting that they may recede there is one certainty. Five years from now construction costs will not be so low, materials so cheap, that the $5,000 home or property built today will have shrunk in value to $2,500 and if it did shrink to

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

SHEETROCK

The Fireproof Wallboard

It Can't Warp

Every builder should insist upon using Sheetrock because Sheetrock, made from rock, positively cannot warp, shrink or buckle. Atmospheric changes have no more effect upon Sheetrock walls and ceilings than upon the permanent rock from which Sheetrock is made.

With all its durable qualities, Sheetrock can be put up with the same ease and speed as the ordinary wall board. The broad ceiling-high sheets can be sawed like lumber and as easily and securely nailed to the studding or joist. Sheetrock patented nailing edges afford great nailing strength and make possible tight, flush joints. The joints, when treated with Sheetrock Finisher, are effectively concealed when the wallpaper, paint or calcimine is applied.

Sheetrock jobs, in short, combine all the strong, lasting fireproof qualities of the standard wall and ceiling with the economy of the usual wallboard.

We are ready to give your order for Sheetrock our prompt attention.

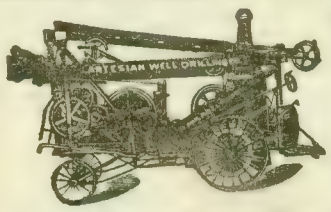
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

ment. It is a sound business proposition which deserves to be considered by the man who contemplates home building in the face of some unfavorable factors.

HUMAN NATURE AND THE FACTORY BUILDING

The modern science of factory management is now turning its attention very seriously to the human element as the most important factor in production. In the past, machines and the processes of production received first attention. The pioneer work of efficiency engineers has concerned such subjects as rate of lathe speed, position of tools, elimination of unnecessary movements on the part of operators, etc.

Even when attention was given to the workmen themselves, they were considered as almost mechanical elements in production. Only recently has it been realized that operatives must be studied and cared for as human beings, that is, as possessing such qualities as initiative, pride, loyalty, and other self-activating motives. This new point of view seems likely to revolutionize industry. It promises discoveries among human forces comparable perhaps to epoch-making mechanical inventions.

As Z. G. Simmons, President of the Simmons Mfg. Company has said, "The time is fast approaching when it will no longer be possible to work any of the great revolutionary economies in industry that were brought about with the steam engine, by the discovery of the application of electricity, and by the discovery of the process of making steel; I believe the next great field of economy in industry is the conservation of the human equipment in our plants."

As the study of human efficiency becomes developed, it will naturally divide itself into two parts. One will concern itself with those means of increasing efficiency which are brought directly and consciously to bear upon the employees. All forms of instruction, of education, nearly all so-called welfare work, belongs to this class. The second will consist of those elements favorable to productive efficiency which are brought to bear upon the employees quietly, unobtrusively, without the need of their conscious attention.

As an example in the first field, an operative in an automobile factory is taught a certain time-saving method of using an assembly wrench. As an example in the second field, the work itself is so set in relation to the source of light that the operative's body will not cast a shadow on it. The one is an example of consciously learned, the other of unconsciously learned efficiency.

Consideration of the human element in production must start with the factory building itself. It must be so designed as to accommodate the necessary machinery and its accessories, with due regard to convenience of taking in raw material, production, routing, assembling and shipping the finished product. It must also contain the necessary accommodations for the employees, including toilet rooms, rest rooms, etc. But thirdly, too, it should be designed with due regard to those unconscious elements in human nature that make for true efficiency. A successful factory building, in other words, has certain characteristics which in themselves promote the welfare and health of the employees, or add to their satisfaction in their work, or otherwise favorably influence their morale. The more important of these characteristics of a successful factory building in relation to the morale of employees will now be discussed.

APPEARANCE OF THE BUILDING

In designing a factory, the appearance

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

of the building itself has only recently been given due consideration as bearing on the efficiency of employees. Yet it has a good deal of importance. Station yourself near the entrance of an old-fashioned factory and note the faces and general attitude of the employees as they come to work. Then watch the employees entering a modern, attractively built factory and you will see a marked difference. In the latter case, the employees unconsciously display an attitude of interest, of zest, and even pleasure, as they approach their work. Many of them have come from homes which are unattractive, hence the appearance of the factory building appeals all the more to them.

The design of the modern industrial buildings shows a close adaptation to its purpose; and right here, in the simple relation between its functions and its appearance, lies its chief beauty. Indeed the true factory building is a symbol of American industrial life, simple, sturdy, well-proportioned, clean-cut, trim and business-like, yet not cold or unsympathetic, but rather appealing and hospitable in appearance. Such an effect is produced by careful use of suitable materials rather than by ornament, rather by harmonious porportions than by elaboration.

One structural element has done much to give the present-day factory building its character. The demand for a greater degree of daylight, arising from the accuracy and speed required by modern factory work, has brought into being the type of window known as steel sash. Because steel sash can be combined into large openings, architects have availed themselves of the opportunity to design factories with bold expanses of windows, separated only by the brick or concrete pilasters necessary for structural support. A characteristic and really beautiful type of building has thus been developed in America, as individual as our skyscrapers and quite as original.

This daylight type of factory building is naturally very attractive in appearance. The expanse of windows gives a cheery, wholesome effect, while the straight lines of the pilasters or columns suggest dignity and strength. Workmen in such a factory can scarcely help having a feeling of pride and satisfaction and good will for the institution. Such an attitude should not be difficult to turn into real loyalty of incalcuable value.

The interior of the factory building exerts, of course, a much more profound influence on the operatives.

DAYLIGHT AS AFFECTING MORALE

Undoubtedly the first and most important factor is the amount and character of the light itself. Natural light has in itself a strong influence on human nature, an influence not only psychological but physical. Probably through racial inheritance every one feels the repressive effects of darkness or semi-darkness. It associates itself with gloom, dullness, sluggishness and fear. Light, on the contrary, especially daylight, has opposite associations. Its influence is in the direction of cheerfulness, brightness, energy, productiveness and courage.

There is no element in the factory building so valuable in its effects as daylight, yet its value and its application are not by any means fully understood.

The results of adequate daylight in factories are listed by a recent writer on the subjects as follows: Unconsciously increased output; finer and more accurate work; less rejections by inspectors; improved morale of the force; more carefully kept tools, machines, instruments, and so forth; less lost and mislaid material; fewer avoidable accidents; less sickness, colds especially; less cost for artificial lighting.

CLEANLINESS AND SANITATION

An indirect benefit from adequate daylight is cleanliness. Dark, shadowy corners are natural breeders of dirt. Light is a natural incentive to cleanliness. In a recent address to industrial engineers, a well-known executive stresses this point.

"More and more every day, however, up-to-date business requires that both the individuals of an organization and the place of business must be neat and clean. The day of the slovenly shop, or store, or office, and the day of the slovenly man ended when business began to think progressively. No man can live in dirt and not think dirt. Dirt in corners of a shop, store or office breeds not only the germs of bodily disease, but the microbes of failure."

FRESH AIR FOR EMPLOYEES

The adequate ventilation of factory buildings is also an important element in efficiency and is normally an accompaniment of daylight. For the steel sash used in modern industrial plants are provided with ventilators which permits an ample supply of fresh air. To provide natural currents of air, these ventilators should be properly distributed. In some types of buildings, foundries for example, the question of ventilation is of paramount importance. In such cases large sections of sash can be opened simultaneously by the use of special mechanical devices.

The effects on employees of good ventilation are comparable to those of daylight. They consist in the better health of workmen, increased vitality, greater contentment, etc.; in fact, the practical results are all on the profit side of the ledger.

PRODUCTIVE FACTORS WHICH COST NOTHING

Such then, are the more important elements in the factory building that further the morale of the employee. They operate unceasingly, every minute of the day. And yet for the most part, they cost little or nothing. A good-looking factory is no more expensive to build than an ugly one. Walls with large expanse of steel sash cost even less than the old-fashioned brick walls with small openings fitted with wooden sash. Daylight is cheaper than any artificial light. Fresh air is obtained without price. Even cleanliness in a factory is maintained at very slight expense. All of these factors operate to increase production and hence produce dividends at no cost.

The art of thus designing the factory building so as to further the morale of its occupants has grown out of the industrial experience of the past two decades. The modern reinforced concrete factory building dates back only to the early years of the present century. Such improvements as steel sash and standard buildings are later outgrowths due to the same amount for industrial efficiency.

—*Modern Building.*

UNPOPULATING LONDON

THE PROPOSED CONSTELLATION OF SATELLITES FOR THE GREAT METROPOLIS.

BY JOHN IRWIN BRIGHT

One of the commonest of accepted beliefs is that a city is a "natural" growth and that its size can not be affected by reasoned effort. As a matter of fact, it is the ultimate expression of artificiality, being natural only in the sense that too often it is the product of anarchically minded men. History teaches that the means to limit its size has always been found when occasion demanded it.

Mankind's gregarious instinct, added to the desire for safety and for the economic and social advantages obtainable in a community life, are the prime reasons for the creation of cities. But their is no doubt that, once established, their expansion owes much to the spirit of emulation inherent in the human breast. Plutarch expresses this feeling very well in the following sentence: "Whoever it was, Sosius, that wrote the poem in honor of Alcibiades upon his winning the chariot race at the Olympian games, Whether

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

it was Euripides, as it is most commonly thought, or some other person, he tells us that to a man being happy it is in the first place requisite he should be born in 'some famous city.'"

In our times the restriction of size by defenses is no longer a factor, as walls and moats offer no appreciable resistance to modern arms. Improvements in transport and the invention of machinery have made possible the support of life in highly concentrated areas of people and has seemingly lifted the ban from all limitations of size. The transformation did not occur over night; the span of several generations was required for its full developement; but nevertheless, sufficient time has elapsed for contemporaneous observation to have lost all contact with the preceding radically different type. The ordinary citizen is chiefly impressed by what has immediately preceded him. Within the memory of his father's father cities have never been artificially restricted in size. Every effort has been made to increase them. Every base and noble impulse has worked that end. National and municipal pride, the deep-seated desire to be identified with something of great importance, to be "a citizen of no mean city," the claims of commerce, the lure of the spectacular, the urge for rapid accumulation of wealth (unattainable mirage to the multitude but possible to the few when presented with the opportunity to exploit large bodies of men), the chance to speculate in land values,—all these desires and stimuli work incessantly for physical expansion.

Speaking in terms of a nation's life this movement has hardly had time enough to get well under way and has by no means furnished conclusive evidence of its own permanency. But how curious it is to find public opinion quite convinced that the growth of cities is one of those natural forces which has always existed and which it is hopeless to attempt to control. Scarcely two per cent. of recorded time has passed since the general use of machinery has brought about an all prevading, stupendous change in urban life and, with entire disregard of teaching of history, we accept our present status as the unchangeable heritage of the past. Woodrow Wilson once said that it took at least two years to establish an old college tradition.

It is human to wish to advance; to retract or to interrupt a well established habit of thought is so distasteful that we are apt to deny the possibility of so doing. But there comes a time when the disadvantages of immensity far outweigh its benefits. The concentrated area can not be fed, housed, and provided with the necessities of life. It is this peak of the curve from which dates the present reaction. Unfortunately a mental environment is difficult to change and we have been moving so long in one direction that the return march to sanity will not be undertaken until there is imminent danger of a collapse of the social structure. But we are approaching that moment and there are signs that in some quarters the danger is appreciated.

The absurdity of this nineteenth century legend has been challenged by the recent founding of the city of Welwyn in England. It is very similar to Letchworth, its near neighbor, in that it is limited in population, "organized for modern industry of a size that makes possible a full measure of urban life surrounded by a permanent belt of rural land, the whole of the land being in municipal ownership." Distant twenty-one miles from the heart of London, it is the first of a surrounding group of similar cities designed not to supplement the metropolis but to substitute for it. The effort is being made on a grand scale to unpopulate London, not by restrictive legislation but by affording its inhabitants better, more wholesome, more hopeful places in which to live.

In this there is no clash with the theory that the size of a city at the intersection of trade routes reflects their importance. The future city can be conceived of as a constellation, its nucleus large enough to embrace all true metropolitan activities but only incidentally a place in which to live. Its increase after these wants have been provided for has no connection with economic laws and leads to waste and confusion. Scattered around it will be the smaller members of the constellation, varying in population from twenty-five to fifty thousand. Each of these units will be connected with each other and with the center by a transportation net, regional rather than local in character. Owing to the manageable size of the units and their scientific planning, the use of street cars and other artificial means of locomotion, insofar as intra-mural communication is concerned, will be largely unnecessary. Danger of traffic and housing congestion will be eliminated, for the towns being restricted in size, provision can be made in advance and with certainty for any possible need. By the simple expedients of the surrounding belt of rural land and the control of the destiny of houses, there can be, in the future, no unlooked for or disastrous expansion.

Two thousand three hundred and eighty-three acres of farm land have been purchased for $532,000,000, an average of $223.00 per acre. To cover this outlay and also to provide a working capital for the development of public utilities; 250,-000-7 per cent. cumulative shares of 1 pound each are being issued.

The London *Daily Mail* has leased in Welwyn for 999 years a fifty-acre plot with an option on another similar space for the erection of a model village. Its terms to prospective builders include a few simple regulations making speculation impossible either in leases or in houses. In every case a tenant wishing to vacate must surrender his land lease (there is no absolute ownership in land), and must offer his house at its original price to the ground landlord, the City of Welwyn. This arrangement has worked successfully for some years in Letchworth and there is no reason to anticipate any but a fortunate outcome for Welwyn.

We have recently witnessed many well-meant efforts in this country to solve the "housing problem" on conventional lines. None of them has succeeded. The triumph of Letchworth, the faith of Welwyn are based on an intelligent idealism and a courage which defies the unknown.

We have long boasted that these traits of character are essentially American and unless we use them in our present emergency, our housing problem will remain for us a perennial affliction.—*Journal of the American Institute of Architects.*

PEP PARAGRAPHS

Soft snaps usually fall to hard-working chaps.

A real boss is one who can get work out of employees.

Truth is often hard to see because it's so near at hand.

Back up your plans with execution, then you're bound to win.

Enthusiasm is the lamp which throws light into the darkest corners.

Failures follow the well-beaten paths because they demand the least effort.

A man's worst enemy is his own disinclination to do the things he knows he should.

Dollars don't grow on bushes, but they fall to the guys who go out to gather them in.

If you haven't faith in what you're doing, it's a good hunch that you're just where you don't belong.

No one succeeds by sitting around waiting for something to turn up, but by getting out and doing the turning.

As The Editor Sees It

DISCUSSION of the still unsolved problem of housing the homeless goes on, but as yet no definite course of action has resulted from the discussion and the situation remains acute and grows more serious daily. According to recent statistics one million weddings were celebrated in the United States in 1919, but only 70,000 new homes were erected—400,000 short of the actual needs. In 1890 an average of 110.05 families occupied each 100 homes. Today there are 125 families for each 100 homes and no relief is in sight. With a conservative estimate of 27,900,000 families in the United States by 1925, at least 500,000 homes must be built and then the building program would be on a small scale. At these figures the country would only have 129.06 families for each 100 homes.

If something is not done to remedy the situation by 1926, with the increasing number of families, 2,200,000 dwellings will be necessary. The erection of 3,400,000 homes by 1926 will be necessary if the country returns to pre-war conditions of 115 families for each 100 homes.

In certain cities in New York state the shortage of homes is so great that parents, who have searched in vain for new quarters, are, as a last resort, seeking to place their children in institutions or boarding houses. County welfare authorities have received hundreds of requests in recent months for accommodations for the children of parents who though in very comfortable circumstances can not find rentable houses for their families.

Philadelphia's Housing Association will determine just what this city needs in the way of houses and just what is available at present, through a survey of this territory. After a recent meeting of the Association the following statement was issued:

"We believe that the following will be accepted without question by those in touch with local housing conditions:

"There are practically no vacant houses in Philadelphia except those held for sale only and those out of repair or unfit for human habitation.

NOT ENOUGH HOUSES

"There are not enough houses in the city to accommodate its population at the rate of one family to a house or one family to an apartment.

"Though the number of houses for rent is slowly increasing—the increase being due largely to difficulty in fianancing individual home buyers—it does not meet a tithe of the demand.

"There are practically no vacant houses in good repair for rent at $30 a month or less. When such a house is vacated by one family it is immediately re-occupied by another.

"Many single-family dwellings recently have been and now are being converted into two-family dwellings and tenement or apartment houses.

"Many single-family dwellings are occupied without alteration or conversion by two families or more.

"The tenants or owners of many houses rent single rooms both to individuals and to families. Many of these single room tenants do little housekeeping."

S. W. Straus, president of S. W. Straus and Co., is very optimistic concerning conditions in the near future and says:

"A somewhat better tone is indicated in the building industry by reason of tendencies toward a more stabilized labor situation. Unmistakably the people of the nation are becoming aroused to a consciousness of the widespread need of thrift. Not only have we reached a place where there is manifest unwillingness to tolerate increases in the cost of living, but there is an indicated appreciation of the fact that thrift of time, as well as thrift of money and all other forms of material wealth, is essential. The tendency toward better labor conditions, which comprises one of the outstanding features of the building situation at the present time, may be taken as the manifestation of a growing appreciation of thrift as a stabilizing necessity.

"These conditions should not be accepted as indicating an immediate resumption of pronounced activity in construction work. There is no improve-

BLUE PRINTS

ment of consequence to be noted in actual building operations, and, at this season of the year, it cannot be expected. However, there are reasonable expectations that the spring building season of 1921 will open with considerable activity.

"The building shortage throughout the country is still acute, and, while the people have found it possible to adapt themselves to cramped conditions for the time being, they will not be content with this situation permanently. It is a part of human nature to seek continually higher standards of living. There is bound to ensue sooner or later a very pronounced home building movement which will be hastened as we approach stabilized conditions of labor and other essential building costs.

"Shifting conditions still prevail in the price of building materials, and it would seem the part of wisdom to maintain a cautious and careful policy with regard to cost tendencies. Basic economic conditions should not be lost sight of. Stocks of merchandise which are now being sacrificed must be replenished, high taxation will continue for some time, the tremendous amount of financing that has been done in recent months on a basis of high interest rates will continue to have its effect on commodity costs, and there is a shortage of many commodities, particularly buildings of all descriptions. Current tendencies, therefore, must be analyzed on a basis of these fundamental conditions, and too much emphasis should not be placed on conditions that may prove to be only temporary and from which there may be a reaction."

* * *

The State Board of Examiners of Architects find that many men are holding their applications for registration in Pennsylvania. The Board is anxious to serve every one as promptly as possible. They hope that the applications may be submitted promptly so that all of the architects who wish to register on the basis of previous practice may file their applications in sufficient time that they may be acted upon before the expiration of the time set in the Act.

The experience of other States having similar provisions to that of Pennsylvania find that the individual who has received registration is recognized by public officials and others who are charged with the employment of architects to a much greater extent than those who simply file affidavits setting forth the fact that they have been in practice the required length of time but have not qualified so that they may use the title of Registered Architect.

The first full examination will be held in Harrisburg, Pennsylvania, December 28th to 31st, 1920. All persons who wish to enter upon the practice of architecture are required to qualify, also persons submitting applications for registration whose experience has been insufficient to have their requests granted, are invited to take this examination so that their qualifications may be established.

WORKING MEN AND WOMEN APPOINT COMMITTEE ON TOWN PLANNING AND HOUSING

Carpenters elect Spokesman to confer with Associated Building Trades—Chamber of Commerce and other Bodies.

As a partial result of recent educational and informative activities among the ranks of labor three organized branches in Philadelphia have appointed Committees on Housing and Town Planning within the past week.

The Chairman of these Committees are:

John C. Walsh—Council Associated Building Trades.

W. T. Allen—United Brotherhood of Carpenters and Joiners.

Harry Weinstock—Central Labor Union.

A preliminary meeting attended by fourteen members of these combined Commitees was held last week in the office of John I. Bright, Otis Building, Chairman of the Commitee on Community Planning of the American Institute of Architects.

Arrangements are being made for a joint meeting of the members of these Committees together with representatives from Union Labor College and various Labor Unions in Philadelphia and vicinity to consider plans for carrying forward a program of education and information including lectures and meetings devoted to these important phases of community development.

At the recent regular meeting of the District Council of the United Brotherhood of Carpenters and Joiners, in addition to the above Committee another Committee was appointed of which D. Knickerbacker Boyd, Architect, was elected Chairman and at the same time Spokesman for the Brotherhood comprising twelve thousand members in Philadelphia and vicinity.

Mr. Boyd, who was previously made Spokesman for the Associated Building Trades representing nearly fifty thousand workers, was invited by the Industrial Relations Committee of the Chamber of Commerce of Philadelphia to attend one of the meetings with representatives of the Council and is now in communication with that Committee looking toward a general conference of employers and employed, regardless of the affiliations of either,

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

SHEETROCK

The Fireproof Wallboard

Rigid Tough Durable

Nailed directly and securely to the studs or joists, Sheetrock—rigid, tough and durable—retains its original shape and condition year after year. Made from pure gypsum rock, encased in a heavy protective covering, Sheetrock cannot warp, shrink or buckle. It resists heat, cold and sound. It is fireproof.

And Sheetrock edges are reinforced with the Patented U. S. G. Reinforcement for protection in handling, for extra nailing strength and for a tight, flush joint. It is clean, dry and uniformly surfaced; it takes any decorative treatment—paper, paint, panels.

Sheetrock is quickly put up; it can be sawed and nailed like lumber; it is economical and profitable to apply. We can make prompt deliveries of Sheetrock.

Sheetrock is ⅜ in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long
A Complete Line of Moulding and Studding to be used with Sheetrock

Labor Temple, Tenth and Tatnall streets, Wilmington, Del. Architect, C. R. Hope, Dupont Building, Wilmington, Del. Owner, Labor Temple Union Association, care of M. G. Sauter, 232 North Franklin street, Wilmington, Del. Brick, second and third story add., 40x110 feet, 60x30 feet, Barrett roof, pine floors, steam heat, electric light, terra cotta iron stairs. Architect is subletting.

Residence and Garage, Lewes, Del. Architect, Edgar A. Wightman, 1213 Filbert street, Philadelphia. Owner, Roland Marsh, Lewes, Del. Frame and stucco, 2½ stories, 24x35 feet, garage, 1½ stories, 22x22 feet, shingle roof, brick foundations, cement, pine and oak floors, hot air heating, electric lighting, tile work. Revised plans in progress.

Buildings Spec. 4301, Bellevue, D. C. Architect, private plans. Owners, United States Government, Bureau of Yards and Docks, Washington, D. C. Reinforced concrete and brick, office and laboratory, 2 stories, 200x60 feet, machine and testing shop, 2 stories, 300x82 feet, pattern shop, 2 stories, 100x60 feet, foundry, 1 story, 100x60 feet, power house, 81x69 feet, built-up roof, wood, tile and linoleum floors, waterproofing, iron work, hollow metal doors, rolled steel sash, steel work, tile and marble work, electric lighting, steam heating. Contract awarded to Boyle-Robertson, Evans Building, Washington, D. C.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., Nov. 18, 1920. Sealed proposals will be received at this office until 3 P. M., Dec. 10, 1920, and then opened, for new roof, repointing, etc., at the U. S. Mint, Philadelphia, Pa., in accordance with the specifications and drawings No. 8C, and 442, copies of which may be had at this office or at the office of the Custodian, in the direction of the Supervising Architect, Jas. A. Wetmore, Acting Supervising Architect.

The election of seven directors of the Master Builders' Exchange to fill vacancies caused by expiration of terms of old directors was held last week and the following were elected: James S. Talley, William S. McCarthy, C. Stanley French, J. Walter Maxwell, S. W. Sinclair, James W. Pearce and Charles H. Fowler.

for the individual prosperity of the "open shop" principle, according to the Philadelphia Board of Trade, which recently went upon record in the unanimous adoption of the following statement:

'The Philadelphia Board of Trade is convinced that the employer of labor in all branches of industry should stand as a unit in opposing every effort, individual and organized, to graft upon American industry the 'closed' shop. The board holds:

"That no person should be discriminated against on account of his affiliation with or non-membership in labor organizations.

"That the management of business should be freed from the dictations of labor organizations and the employment of labor should be upon the basis of their equipment for the work in hand, and their discharge upon the proof of such lack of equipment or inability to comply with the just demands of such service.

"That the principle of fair dealing between employer and employee should characterize their relationship and form the basis of true Americanism and guarantee the stabilization of labor conditions."

This action followed a report by the Board's Committee on Domestic Production, which submitted that developments of the past few weeks indicate that those who have expressed confidence in the final good sense of the American workingmen have been confirmed in their faith in Americanism with assurance that the nation will continue its advocacy of the "open" shop.

It was pointed out that at present there are 540 organizations in 247 cities of forty-four States of the Union engaged in promoting the American principle in employment relations, and working upon the principle that labor's willingness to produce must afford the basis of individual prosperity, while capital is all essential in that it supplies the only practicable means of providing the tools wherewith the workmen may produce and market his products.

OPERATIVE BUILDERS TO PUSH RELIEF COMMITTEE PLAN

DECISION REACHED AFTER PROPOSAL OF G. W. NORRIS UNITING ALL ELEMENTS

Governor Sproul of Pennsylvania and Mayor Moore of Philadelphia will be asked to form a committee to consider housing legislation and means of housing relief in this city by officials of the Operative Builders' Association.

The decision was announced following the proposal of George W. Norris, Governor of the Federal Reserves Bank, who urged the formation of a body representing labor, builders, financiers, the State and city and all other agencies interested in relieving the acute shortage of dwellings here at present.

Mr. Norris urged the formation of the committee following a conference with officers of the Builders' Association, and declared that it should serve the purpose of balancing all factors in the situation and working out the most logical means of relief.

In addition he declared that facts concerning the shortage and the percentage of congestion which would be relieved by new building operations could be gathered and properly prepared for presentation to the State Legislature in case any bills were agreed on for presentation.

INDORSED BY BUILDERS

"We are in thorough agreement with Mr. Norris' suggestion that a committee representing all interests in the housing situation be formed without delay," said Daniel J. Crawford, president of the Operative Builders.

"We have heard so many favorable comments upon the plan today that it is our purpose to visit Mayor Moore and Governor Sproul and consult them on ways and means of organization. We will ask for the naming of a committee to deal with the situation and endeavor also to learn the views of the executives who are and will be most closely in touch with developments during the next six months."

Mr. Crawford after a consultation with other officials of the Builders' Association, including John N. McGarvey, Harry Bauer and J. Franklin Moss, declared that consultation with men high in financial circles have confirmed the association's statement that the drop in the cost of living is almost certain to stop when it reaches a rate about 100 per cent. above 1914 costs.

"We have been confirmed in our opinion that the present situation with its avalanche of falling prices is unusual," said Mr. Crawford.

"The condition has arisen through a combination of high money rates and restriction of credit added to a refusal of the consumer to take up merchandise quickly.

"The result is that many concerns are throwing seasonable goods on the market at very low prices and in larrge quantities. They are doing this because they must unload, but bankers with whom we have been in touch believe that the replacement value of new stock will be higher than this forced sale value, which we are now experiencing.

HINGES ON LABOR COST

"If common labor is going to be a basis of costs for the future and is to remain at fifty cents, then it is likely that new housing values will continue to be 150 per cent. in excess of the 1914 building prices.

"We builders figure that 50 cents an hour for unskilled labor is three times the 1914 rate, while $1 an hour for skilled labor is twice the 1914 rate. If that proportion continues, here is how the cost will figure out on a house that could have been built for $2,000 in 1914.

1914 cost	$2000
5 per cent. off for raw material	100
	$1900
Common labor 60 per cent. of total	$1140
Skilled labor 40 per cent. of total	$760
$1140x3	$3420
$760x2	1520
Raw material	100
Total	$5040

This cost of $5040 is borne out by our actual experience as builders and applies proportionately to all larger houses. We have prepared the following data, which shows how this matter is controlled by the cost of living and how living cost must be the real basis for fixing standards of value for houses to be erected next year.

"A report of the Department of Labor recently issued discloses the increased cost of living in Philadelphia from December, 1914, to June, 1920, to be 113½ per cent.

"The National Industrial Conference Board in their research report No. 30, recently issued, discloses the fact that the average cost of living thrughout the United States has increased 104½ per cent. between July, 1914, to July, 1920. This is based on the following table.

Budget Items.	Relative importance in family budget.	Increase in cost between July, 1914, and July, 1920.	Increase as weighted in total budget.
	P.C.	P.C.	P.C.
All items	100.0		104.5
Food	43.1	119	51.3
Shelter	17.7	58	10.3
Clothing	13.2	166	21.9
Fuel and light	5.6	66	3.7
Sundries	20.4	85	17.3

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

"In analyzing this table we find that shelter is listed as having an increase of 58 per cent. and fuel and light 66 per cent. These figures must be very greatly increased when taking into consideration any increase in the present supply of shelter, which, at the present time, is costing at least 150 per cent. above the old rates, and there is very little doubt but that it will be necessary to increase the rates for fuel and light so that these items will represent an increase of not less than 100 per cent.

"Coal, one of the principal items, has increased in price from $7.15 per ton in 1914 to $14.80 per ton at the present time, and all of the public service companies furnishing gas and electric light are complaining bitterly that they cannot continue to give service at the present rates, so that it will doubtless be necessary to increase them.

"Taking these factors into consideration, the table would appear as follows:

	P.C.	P.C.	P.C.
Food	43.1	119	51.3
Shelter	17.7	150	26.5
Clothing	13.2	166	21.9
Fuel and light ...	5.6	100	5.6
Sundries	20.4	85	17.3
	100.0		122.6

"Granting that there will doubtless be some reduction in the cost for food and clothing, the indications are that the cost of living will not be reduced to less than 100 per cent. above the cost for July, 1914. If wages in the building industry are to be regulated in accordance with the increased cost of living, it would appear that the mechanics who formerly received an average of 50 cents per hour will be entitled to an average of $1 per hour.

"For many years common laborers were paid 17½ cents per hour, and it is generally admitted that this rate was not sufficient to pemit a man to provide the ordinary necessities of life for his family, and most employers will readily concede that this class of labor should have been paid a rate not less than 25 cents per hour under the old conditions, and, keeping this in mind, the rate for common labor should be about 50 cents per hour."

THE PERPLEXITIES OF FURNACEMEN REMOVED

COMMON SENSE BASED ON OBSERVATION AND EXPERIENCE REACHED CONCLUSIONS THAT ARE SUPPORTED BY SCIENCE

Do not allow any complaint about the trouble with the furnace find you perplexed as to what to do. Always be confident that the objectionable effect is the result of a cause. Then set about to find the cause by going over the various things which could produce the complaint.

In furnace heating systems what is intended to happen never happens until the fire is started. Then air in contact with any of the hot surfaces is heated, made lighter and must rise. And it will rise if there is provision for it to flow away without friction and other air to flow in as easily to take its place. The man who is a hair splitter will say the same bulk of air will weigh the same whatever the temperature, but to listen to him will cause more trouble, so forget it. Remember the air that fills a cubic foot of space gets lighter as the temperature rises.

Air expands with heat and the hotter it gets the less of it will be required to fill 1 cu. ft. of space. Consequently 1 cu. ft. of hot air is lighter than 1 cu. ft. of cold air. Again air expands and the same bulk is lighter as it is heated and in a properly arranged furnace system it must move. If it does not move, something is wrong and the reason can be found by searching along the line that it would move if it were unhindered. So the hindrance must be found.

A furnace is an air heater and some say a coal eater. It certainly cannot heat unless fuel is burned, but if it is burned it will heat. Sometimes coal is not properly burned, due to mismanagement, and less heat is available than is economical; consequently the fuel is wasted.

With the fire burning the fire pot and the radiators are hot so the air coming in contact with them must move if possible. To make it posible a supply of air must flow in constantly from somewhere.

THE SCOURCES OF AIR SUPPLY

In common practice air is taken from one of three places. One is from out-of-doors by means of a duct leading from an open window directly to the furnace with as few abrupt turns as possible. It is also taken from the room or cellar where the furnace is placed, and from the inside of the building and kept in circulation by means of one or several ducts.

From all three sources there are causes of complaint. If the supply is from out-of-doors, the wind may blow directly into the window from which it is taken and sometimes may drive more air into the furnace than it will heat. The dampers must be adjusted to stop some of it, and again the damper must be adjusted when the wind goes down to allow enough air to enter.

Then the wind may blow by the window and suck the air out of the furnace so that snow on the ground nearby will melt. This requires a guard to turn some of the air into the duct. The guard may be built by placing a three sided box over the window with two ends open, but with the top, bottom and one side closed. A vertical damper is placed in this box pivoted at the top and bottom at the side away from the window. Stops should be provided so that the damper can only blow far enough to let the air into the duct from whichever direction it flows and shunt it into the duct to the furnace. Wire screens over the openings will keep out leaves and other foreign matter.

The controlling damper in the duct should be made so that it cannot be shut more than two-thirds and so constructed and hung that under any conditions a strong wind will close it to that extent. To facilitate the inflow of air when the atmosphere is still, it should be so constructed as to afford the least friction possible. It should be air-tight and is best made of galvanized sheet metal. Where it is connected with a window, the glass sash should become a part of it near the top so that the light from outside will still be available in the cellar. There is an advantage in having it run under the floor from the window to the furnace. Then the duct should be carefully built and smooth and should enter a circular pit under the furnace. In the past a pier has been built in the center of the pit to support the weight of the furnace but it is belived better practice to use an I-beam to carry the weight so that the air can rise to the hot surfaces and air passages of the furnace without deflection or influence.

WHEN AIR IS TAKEN FROM THE CELLAR

If the air is taken from the cellar it is apt to cause trouble when the fire is cleaned or ashes removed, for any dust raised will be carried up with the air passing through the furnace. Again, when severly cold weather comes and snow banks the cellar windows, no air can get in and the furnace fails to send up warm air for heating the house. Then if the cellar door in the kitchen is opened, it will slam shut as the air from the different rooms in the house race to the cellar in a circulation movement which the hot furnace insures.

Sometimes a duct is run down from the window to within 1 ft. of the cellar floor. This provides plenty of air but makes the floor cold and does not stop the dust and dirt nuisance.

There has been quite a general increase in the use of air from within the building carried back from a register in the hall floor or from several registers in the

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

colder points of the house. This method of air supply saves coal, aids the heating and is growing in popularity. In some instances 10 per cent. of the air supply is taken out-of-doors for the refreshing effect.

In some instances screens are put into the cold duct or there is built in the cellar a large chamber provided with screens covered with cheesecloth to catch the dirt carried by the air. If these screens are not frequently cleaned or renewed, they will fill up and prove a very effective damper against any flow of air through them.

TO DETERMINE SIZE OF AIR DUCT

This tells how to get the air to the furnace, and the importance of avoiding all possible friction should be again emphasized. Nothing has been said of the size of the air duct or the volume desired. That is governed by the combined area of the warm-air pipes, in the opinion of the most successful furnacemen.

In former times it was considered sufficient if the area were equal to two-thirds or three-quarters of the area of all the pipes, because, when heated, it was expected to expand enough to fill all the piping. This may be true when the weather is cold but in the early fall and late spring when the fire is still necessary and yet the temperature of the air out-of-doors may be about 40 deg., the larger duct is more desirable and the amount of air can be governed by dampers in colder weather.

Those advocates of an entirely out-of-doors air supply for health reasons overlook the fact that the house is ventilated only through the escape of the air around doors and windows or through open fireplace flues or in some similar way. They overlook the fact that any indirect heating system which carries heat along with the air, over-ventilates to a great extent and is consequently expensive. They overlook the fact also that so much ventilation is not essential and may be regarded as extravangant in the use of fuel.

When there is a complaint that some pipe from the furnace is not sending up warm air, if the duct arrangements or the supply is in accordance with what has been said, the cause of the trouble must be looked for at some other point. However frequentlly the air supply duct is too small in area and then it is not an uncommon thing for air to go down one warm-air pipe on the cold side and up a warm-air pipe on the other side of the house. Then the mingling of this cold air with the air warmed by the furnace reduces the temperature of the air flowing out from all of the hot air pipes and interferes with the heating of the furnace.

Where there is suspicion of something of this sort, a lighted match will show whether the current of air is up from the register or down into the register. Sometimes the failure of warm air to flow from different parts will be due to the fact that the controlling damper in the air duct needs attention and needs to be opened because there is less wind out-of-doors, or the out-of-door temperature is higher and more air should be allowed to pass through the furnace.

In almost all furnace calculations the warm-air pipe area, so far as the leaders in the cellar are concerned, is apt to be correct. But unfortunately in many instances the pipes are connected with risers that have nothing like the same area and consequently the flow of air is throttled down and there is a loss of heat through the pipes exposed in the cellar. Or quite frequently the pipes are connected with registers only 2 in. greater in diameter than the diameter of the pipe or when rectangular they are too small. Then the fretwork reduces the outlet area until the register serves very effectually as a damper to the flow and the air is held back to lose a good deal of temperature in cellar.

SIZE OF REGISTERS AND RISERS

Registers and risers should be of ample size and the free area of registers should preferably be somewhat in excess of the actual area of the pipe. A hot cellar frequently is caused by the outlets from the leaders from the furnace being too small to allow the heated air the leaders carry or the heat in the air they carry to flow to the point where it is needed. In consequence the heat is given off in the cellar, making it wasteful and hotter than is desirable if used for food storage.

There is opportunity for some reduction in the size of the leaders and the risers to rooms on the second and third floor, owing to the fact that the flow of air is more rapid to the upper rooms in proportion to their height above the furnace. To proportion the leaders for the first floor room, it is necessary to consider the heat required for the room. This is more due to the exposure and the amount of the exposure than it is to the cubical contents of the room. If a room is on the north or west side, it will require from 10 to 20 per cent. more air or heat than if it were on the opposite side of the building. If the room has two or three walls exposed, it will require at least two or three times more heat than if only one wall were exposed. It has been quite a common custom to figure the glass as the principal cause of heat loss in rooms artificially warmed in the winter season. Therefore the wall loss is based on the number of square feet of wall surface that will lose as much heat as 1 sq. ft. of glass surface. Often 4 sq. ft. of wall is considered equivalent to 1 sq. ft. of glass in transmitting or losing heat.

For first floor rooms where a generous provision is to be made and a certainty of success is desired, it is better to provide 1 sq. in. of warm-air pipe area for every ¾ sq. ft of glass surface or equivalent glass surface exposed. It is common practice to make 1 sq. in. to 1 sq. ft. and in some instances 1 sq. in. is reckoned to take care of even glass surface. This is not safe for either north or west rooms on the first floor, but it may give satisfactory results when applied to rooms on the second or third floor. In fact then 1 sq. in. may be able to take care of as much as 2 sq. ft. of equivalent glass surface on an upper floor with a southern exposure because, the first floor being warm, the warm air from it will rise in the halls and the ceiling of the warm first floor will transmit heat to the floors of the second floor rooms. Again it is seldom desired to maintain as high a temperature on the second floor as on the first floor.

With this method of getting at the size of the warm-air pipe for first floor rooms it is a simple matter to figure the sizes of the windows and doors which are considered equal in the heat losing power to the glass of the window. Then it is necessary to subtract this from the wall surface, divide the wall surface by 4, add it to the glass and door surface and then provide 1 sq. in. of warm-air pipe area for ¾ sq. ft. or equivalent glass surface. Then, when the area of the various pipes have been determined and added together, the size of the cold-air supply duct can be safely computed.

It is not an uncommon thing for people desiring ventilation to neglect to shut off the register while they will open the windows of a bedroom when it is occupied for sleeping. This lets the hot air flow out of the register as fast as the furnace can handle it and still will allow the cold air to enter the bed chamber and make the walls as cold as if they were out-of-doors. This makes a difficult room to heat in the morning and will carry off the heat from the other parts of the house. If the window is to be left open the register into the room should be closed by all means.

These are a few things which the man who is having complaint should keep before him. —*Sheet Metal Worker.*

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

As The Editor Sees It

ANY indication of a reduction in the cost of building materials is very welcome at this time. The Flintkote Co., Inc., Manufacturers of Asphalt Shingles and Prepared Roofings have recently sent out an announcement to the effect that: Substantial price reductions ranging from 24% to 31% were effective November 16th. This concern manufactures asphalt shingles and prepared roofings—products which are used in great volume in connection with residential building, and on renewals and repairs.

This company operates four plants, and is affiliated with several other plants. With regard to shipping arrangements, this gives them numerous and logical shipping points from which they distribute to all parts of the country east of the Rocky Mountains.

From a statement sent out to the trade the Flintkote Company state, "We have revised prices for the purpose of re-establishing a basis upon which purchases may be made with confidence. By reductions ranging from 24% to 31% on important items we have sincerely endeavored to attain a price level from which further movements should be upwards.

We can only accept orders for limited quantities in accord with a uniform plan to insure fair and equal opportunity to all of our customers."

An expression from the Flintkote Company indicates that they have taken all the shrink in their inventory that raw material, conditions, or expectations will warrant.

It is interesting to note that they report a quick response from their trade, and orders indicate that moves of this kind are awaited by people who are ready to buy.

However, in spite of the small demand for construction, there is but little weakening in the price of building materials generally. "Cotton, wool, leather, sugar and grain prices have fallen," says the *American Conctractor.* Lumber prices have dropped and steel prices are weakening. The trend of prices is toward lower levels.

During the war all these essential staples were extended every aid and consideration. Government agencies were established to increase their production. Transportation facilities were placed at the producer's call, finance was devised for his assistance. The campaign was for increased production of cotton, of wool, of grain, of steel and lumber.

When the war ended with unexpected suddenness, vast stocks of these materials were on hand and in all the producing fields were efficient producing organizations. There had been a careful and studied effort not to interfere with producing organizations in these fields. They suffered the minimum inconvenience during the war.

What about the building material industry? From the very beginning this industry was called on to make every sacrifice conceivable. It was denied transportation facilities, it was discriminated against through prohibitive freight rates, it was denied coal and fuel on positive orders of the national fuel administration, finance was diverted from the material manufacturing field and from building projects. There was no accumulation of stocks and, what is vastly more important in its present effect on prices, the producing organizations of thousands of building material firms were actually dispersed and the labor diverted to other fields.

Here is the fundamental difference between conditions in the general market and conditions in the building material market. Lumber and steel, of all building materials, were the only ones to enjoy the protection essential to preserving their producing organization unimpaired. Lumber and steel products were diverted, it is true, to war needs, but production was stimulated rather than discouraged and producing organizations were preserved intact. Lumber prices now have fallen and steel prices are weakening.

Brick prices, in the face of a diminishing demand, have remained practicably stable; there has been no weakening in cement prices, sand and gravel shows no signs of materially lower prices.

Transportation and fuel are very important factors in the material market.

DRAWING MATERIALS
CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614
BLUE PRINTS

The real hope for lower prices in brick and cement is in the price of coal. The coal operators have been profiteering. They have been black-jacking the public since and during the war. Coal prices can and must come down and cheaper coal will make cheaper brick and cement possible.

Knowing the tremendous demand that is piling up it is difficult to believe that spring prices will be below present levels in so far as the actual buying prices of materials are concerned.

This does not mean, necessarily, that construction costs will remain as at present. Labor is more prone to deliver a fair day's work, and the productive increase incident to improved efficiency is after all the chief factor in the downward tendency in construction costs. By spring transportation conditions are going to be better and the wasteful and expensive delays on account of the non-arrival of materials will be eliminated in construction costs. Continuous operation and maximum efficiency will make a very noticeable difference in construction costs.

* * *

The Architectural and Building Code Service, National Lumber Manufacturers, Association, of Chicago, has recently published and has ready for distribution a bound volume containing a series of plates of "Frame Construction Details." They have been published in 8½ x 11 size for the purpose of handy reference and convenience in filing.

Frame construction, unlike the various other types of construction used in the erection of smaller buildings, has grown from the various miscellaneous types which were developed by necessity in the days of our forefathers to the three distinct types, "balloon frame," "braced frame" and "Western frame," each of which predominates in certain sections of the country. These plates supply a great demand—a great need which has long existed, as they fully show the proper use of lumber in the three types. The valuable principles of economy and safety in construction of frame buildings are illustrated. Specific methods of fire stopping recommended as necessary to prevent the rapid spread of fire in buildings are also illustrated.

These principles and standards of construction when applied in practice will serve not only to reduce the wrong use of lumber, but encourage its proper use. This volume is invaluable to architects, engineers, draftsmen, and students of architecture, as it shows in large scale details the relationship of the various structural members and their function.

It is also of great value to contractors, carpenters and builders and the principles shown should decide many questions which are raised as to the proper method of framing a building.

Lumber merchants in developing the market in their respective localities can make valuable use of this volume, as it shows correct and economic types of frame construction. A man with slight experience should be able to take this book and list the framing lumber for a building, as the relationship of one structural member to another is clearly shown. It is a volume which should be in the hands of every one who is interested in the erection of frame buildings, as well as in the hands of every one who contemplates entering into the field of construction.

Copies may be secured from the Architectural and Building Code Service, National Lumber Manufacturers' Association, 750 McCormick Building, Chicago, at a cost of $1.00 for each copy desired.

* * *

When recently interviewed, Mr. Dwight P. Robinson, President of the Dwight P. Robinson & Co., New York said: "Now that the election is behind us and the general uncertainty from that quarter removed, it is my feeling and that of my associates that a strong revival of general business activity will soon be evidenced in all parts of the country. The demand for living accommodations and office space must be met; to take care of their rolling equipment the railroads must build new terminals and shops deferred by the war; public utilities generally are being granted sufficient rate increases to permit operation at a profit, and the money will therefore be available for the vitally necessary extensions to power, lighting and traction properties; many manufacturing plants must further increase their production by building plant extensions.

"With these facts in mind, the belief must be general that an almost unprecedented volume of construction must be executed in the coming year."

* * *

To convert the postal savings bank system into a national building and loan association from which people may borrow money required to build homes at reasonable interest rates, is the novel suggestion of Representative M. Clyde Kelly, of Pennsylvania. He suggests elimination of the present $2,500 limit on deposits and increase of the present interest rate of two per cent. to encourage deposits.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

(At Left) Barrett Specification 20-Year Bonded Roof on building of Ely & Walker Dry Goods Co., St Louis, Mo. Arch.: Eames & Young. Roofing Cont. Columbia Roofing Co. Gen'l Cont.: Jas. Stewart & Co., Inc

Barrett Specification Roof applied by owners over old pitch, felt and gravel roof on Heel Factory of International Shoe Company, St. Louis, Mo. Arch., F. Hume. Roofing Cont.: Swift Roofing Co.

They are all "from Missouri"—

When it comes to spending their clients' money, architects and construction engineers invariably take the "show me" attitude. Figuratively, they are all "from Missouri."

And the more they insist upon having proof of the durability and economy of the materials which enter into a building, the surer is that building to have a Barrett Specification Roof.

In St. Louis, the hustling metropolis of the Central Mississippi Valley, the "show me" spirit is fully developed; consequently Barrett Specification Roofs cover many of the city's modern buildings.

In a Barrett Specification Bonded Roof the owner not only gets a roof that has proved its superior economy on thousands of buildings all over the country, but he also gets a roof that is bonded for a long term of years against all upkeep expense.

Our Guarantee is a Bond

The Barrett Guarantee is a Surety Company Bond which costs the owner nothing and which absolutely protects him from the expense of roof repairs and maintenance.

This Bond may be obtained on any Barrett Specification Roof of 50 squares or larger, in towns of 25,000 or more, *and in many smaller places where our inspection service is available.* Our only stipulations are that the roofing contractor shall be approved by us and that The Barrett Specification, *revised April 15, 1920,* shall be strictly followed.

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof covering it is possible to construct, and while we bond it for 20 years only, we can name many roofs of this type that have been in service over 40 years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof bonded for 10 years. Both roofs are built of the same high grade materials, the only difference being in the quantity used.

Full details regarding these Bonded Roofs and copies of The Barrett Specifications sent free on request.

SHEETROCK

The Fireproof Wallboard

Takes Wall Paper
Paint or Panels

The fact that Sheetrock can be papered, painted or paneled makes a strong appeal to the home owner. And, Sheetrock, enduring and rigid as rock, is fire-proof. It can not warp, shrink, or buckle. It resists heat, cold and sound.

Further, Sheetrock edges are reinforced with the Patented U. S. G. Reinforcement for protection in handling, for extra nailing strength and for a tight-flush joint. Sheetrock is easy to put up; it can be cut or sawed like lumber; it can be securely nailed to the studs or joists, and will not pull away from the supports.

Factory-finished in the mills of the world's largest producers of gypsum products, Sheetrock is in steadily increasing demand for homes, garages, offices and factory additions; for new construction as well as alterations and repairs. All orders filled promptly.

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long
A Complete Line of Moulding and Studding to be used with Sheetrock

HOUSING PROBLEM INQUIRY FAVORED

Governor Sproul of Pennsylvania appealed to in demanding laws helping housing

Representative builders and real estate men of the state appealed to Governor Sproul, of Pennsylvana, last week, when in conference at Harrisburg, to exert his influence for enactment of legislation to bring relief for the serious housing condition in the State, but the two groups differed as to the causes of the condition and the methods of correction. The realtors contended laws increasing the rate of interest, repeal of the 4 mill tax on mortgages and consequent liberalizing of the money market would help the situation.

Daniel J. Crawford, president of the Philadelphia Operative Builders' Association, declared standardization of the real estate values to stabilize the market was necessary, otherwise "all the money in the world won't help." Mr. Crawford said the situation could not be corrected entirely along financial lines.

A suggestion by the Philadelphia builders for appointment of a commission to study the problem next year met with the favor of the governor, who said a legislative commission would have more widespread authority to act than any he could appoint. The governor said the commission should contain authorities on economic and social problems and Mr. Crawford suggested such men as ex-Governor Edwin S. Stuart, Samuel M. Vauclain, President of the Baldwin Locomotive Works, Phila., John H. Mason, President of the Commercial Trust Co., Philadelphia, and Nathan Folwell, prominent Philadelphia manufacturer. The governor thought a federal law to give real estate loans the same preference as farm loans receive under the federal farm loan act might help, and said a modification of the income tax with respect to real estate would induce those "trying to escape the super-taxes to rush in over night."

Mr. Crawford predicated realty prices would remain high, estiminating they would stay at 100 per cent. above prewar prices. He said wages would drop, but not to where they had been, and that the wage of the common laborer would determine the future values of reality.

"We don't want to add confusion to confusion," said the governor in announcing he would be glad to co-operate if the real estate men and builders would take official action on some plan. He said in the period of readjustment many persons who crowded into industrial centers during the war would return to the country in search of more permanent homes, and referred to vacant houses in rural sections.

"They are going to drift out of Chester and out of Bristol because of the closing of Hog Island and other shipyards. If we could get owners of big properties to stop holding them for speculation it would help. Our fear is that we may do something in haste that will only be temporary," he argued.

The governor referred to a vacant property at Broad and Spruce streets, Philadelphia, "as a sad sight," and to another at Eleventh and Walnut streets as "a menace to the neighborhood, and said there ought to be some way to harpoon the owner."

On the question of the repeal of four mill tax on mortgages, the governor said it might hurt the borrowing capacity of Philadelphia where the county and city boundaries are the same. He said he would refer the question of repealing usury laws and the matter of increasing the borrowing capacity of building and loan associations to the banking department.

Burton C. Simon and Samuel Stern, representing Phila. building and loan associations, urged legislation to permit the associations to borrow 50 per cent. of their paid-in stock. They are limited now to 25 per cent. Mr. Crawford suggested a law to exempt new buildings from taxation, and the governor said authority could be conferred on municipalities to do so.

PUT YOUR SIGNATURE ON IT!

A GOOD SIGN WILL BRING BUSINESS TO THE LIVE BUILDER

IN visiting various sections of the country where active building is taking place, particularly in our smaller towns and communities, the writer has been thoroughly impressed by the fact that there is no class of active business men who are so backward in advertising their activities as the builders. A very large percentage of the thousands of building jobs which are being carried on now in many sections of the country do not carry on the operation any indication as to who is doing the job. The result is that as far as the builder is concerned, no matter how good the work may be or how well it is being done, the passing public, often including prospective clients for the builder, has no way of knowing who the builder may be.

One instance which shows this condition came directly to the attention of the writer in Detroit. This happened to be a Sunday afternoon in a district of Detroit where many new homes are now under construction. As we walked through this section looking over the various jobs, we had occasion to walk into a house which was partially completed. There was found another interested investigator, who introduced himself by asking if by chance we might know who was carrying out this operation. We did not know, but we found to our interest that the man making the inquiry was the owner of several lots in the vicinity who had in mind carrying out a building operation himself, and who intended to have work started within another month. During the rest of the afternoon we went around together, looking over various houses under construction, and the man was particularly impressed by the fact that on several of the houses he saw signs which stated that this work was being done by John Williams, Building Contractor. Among the final impressions of the trip Mr. Williams' name stood out predominantly as a contractor who was doing several jobs locally, and our friend stated his intention of getting in touch with Mr. Williams with the idea of having him handle the new work which was contemplated.

We were interested enough to follow up this matter and found, as we expected, that Mr. Williams had been employed to build six houses for the man in question. Without any doubt this work, involving an expenditure of $100,000, was the direct result of Mr. Williams' foresight in placing signs on his jobs.

Advertisers, even those who are spending hundreds of thousands of dollars in publicity, realize the basic value of presenting some actual result of their activity for public consideration. Certainly there is no way in which the builder may impress prospective clients with his ability in a more powerful way than to demonstrate actual work in the field.

Another instance directly to the point came under the observance of the writer. A building contract was let for a building covering a corner 100 by 100 feet and the first step taken by the contractor was to sublet the excavation work to an excavation and foundation sub-contractor who operated a steam shovel. While many jobs, some of them similar, were going on in this vicinity, this was the first on which a steam shovel was used, and the enterprising builder had a sign

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

which stated that the excavation was being carried out by a steam shovel in order to save time and cut cost. It is interesting to note that several inquires came to this contractor for building work of a similiar nature, all of which were directly traceable to the fact that he employed a comparatively unusual method and used a sign as a medium of telling the public who was doing the work, and why it was excavated in this manner. The natural impression was that this builder is a live wire and a result-getter. He made it easy for inquirers by placing a sign on the job.

A similiar instance was noted on a consruction job involving the building of a row of houses in Brooklyn, New York, where excavating machinery was used to excavate a row of cellars, the entire operation being dug out in a few days. Here again a sign on the job brought a number of inquires from prospective clients,

Sub-contractors and material men are much more progressive in this matter than the average builder. It is a usual incident to see a building job with several small signs on it; one explaining that the furance was supplied by a certain company; another that hardwood flooring was supplied by a certain sub-contractor, and others that specialty lines were being supplied by various individuals or companies. But nowhere a sign stating who was carrying out the building job.

The building of homes and small store buildings is interesting the general public today in a way never before known. Considerable money is ready for investment in this field, and the man who is thinking of building does much of his investigating at first hand on Saturday afternoon or Sunday, walking from one job to another to see how the work is being carried out and what he may expect on his own job. Naturally his mind is open for impressions, and he is in many cases very much interested in a certain operation, particularly if he knows who the builder is.

If you are progressively seeking new business in your field, here is one method of advertising which costs practically nothing, and which should never be overlooked. Have a small, attractive sign placed prominently on the job, so that there will be no question as to who is doing the work.—*Builders' Journal.*

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides, and, following them, you reach your destiny.—Carl Schurz.

WHAT STANDARDIZED LUMBER SIZES MEAN

The need of standard sizes for all the different lumber products has been felt for some time, due to the exceedingly numerous and constantly changing sizes, and the action of prominent lumber men in promoting standardization presages another progressive step in the lumber industry. The United States Forest Products Industrial Research Laboratory at Madison, Wisconsin, has been co-operating during the past year with the National Lumber Manufacturer's Association in working out an equitable basis for standardizing softwood lumber sizes. Some of the benefits to be derived from the standardization of sizes are as follows:

1. It makes possible a common language for all The consumer can substitute one species for another with assurance of getting material of the same size. Similarly, if a contractor starts to build several houses and orders his millwork, sash, doors, etc., based on certain lumber sizes as to stock around which the casing fits, the kind of wood can be varied as he desires.

2. Architects and purchasers can order more rapidly with one set of sizes,—looking for sizes scattered throughout different grading rule books is eliminated.

3. Material of standard sizes is more salable and by increasing the consumer's goodwill creates and adds value to the products.

4. Building design is simplified, since fewer sizes can be used.

5. Uniformity in construction results, regardless of the grading rules under which the material is purchased. Manufacurers now can not standardize millwork, etc., because it is dependent upon the sizes of the lumber used in building.

6. Remanufacture of larger sizes to match smaller sizes will be reduced and greater utilization with less labor and expense result. The architect frequently designs a building in accordance with the minimum sizes of lumber which may be furnished rather than on a species that can be procured in larger sizes.

7. Standardization of sizes eliminates local legislation on lumber sizes which confuse manufacture and distribution. Such legislation has been already suggested.

8. Standardization makes for fewer sizes and hence greater efficiency, ease and accuracy in lumber grading.

9. It equalizes competition between manufacturers, because present differences in overrun and freight charges are important factors in determining price.

10. It makes possible uniform practice and sizes in resawing.

11. It makes possible a fewer number of drying schedules in the kiln drying of lumber. At present the actual thicknesses of lumber of the same and different kinds cut under the rules of different associations often varies several per cent.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

The "Builders' Guide" is in its thirty-fifth year of continuous publication.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

As The Editor Sees It

FOLLOWING the recommendations of the conference of Governors held in Harrisburg, last week, it is to be hoped that some definite action will be taken by State and Federal Governments, to overcome the evils of the present housing situation. When a problem has assumed the enormity and importance of the present housing crisis, and when the crisis is so clearly seen and recognized, we feel that a constructive policy of some sort must be the outcome.

Governor Smith, of New York, said in his message to the conference, which was read by former Judge Edward F. Boyle,

"No problem of reconstruction has such far-reaching implications as this problem of housing. Shall this country remain in the dark ages of inadequate and un-American housing or shall we go forward with the times and enter the new era of our Democracy with an enlightened interest in the fundamental needs of our cities and our citizenship for well-planned communities that serve the industrial, commercial and social needs of the people, and homes that make for a stabilized self-respecting wholesome family life?"

"It is time the country made adequate provision to meet the problem."

"In America our housing laws have been negative, restrictive laws," he declared.

"It seems clear to me that the individual States should themselves work out systems of State credits for State purposes. With the control centered in each State, people will be in more direct and more democratic control of their housing funds and their application to local conditions.

"Belief that a cure for profiteering in rentals will bring about readjustment of the housing problem and that therefore homes will immediately be found for everybody at rentals which they can afford to pay is such a common error that it is not at all extraordinary that even the Federal Government approached the question in the early stages from this angle. Now, here is private initiative filling the demand for houses, and the situation in New York city is of vital interest to the whole community because what is happening and what has happened in the metropolis on a large scale is taking place in a lesser degree and more slowly in every city or town throughout the country."

Governor Sproul's suggestion that income from mortgages be exempt from taxation was viewed with favor and is in line with relief measures suggested by other experts. For instance, Charles O'-Connor Hennessy, a director of the Land Bank of the State of New York, suggests in *Building Industry* a somewhat similar plan to relieve the situation in New York, saying:

"I suggest that at the coming extraordinary session of the Legislature a declaration be made that, in view of the present public emergency, bonds of the Land Bank of the State of New York, when properly secured by dwelling house mortgages deposited with the State Comptroller, be regarded as instrumentalities of the Government of the State, issued for a public purpose. I understand that Governor Smith's Reconstruction Commission has recommended this.

"This declaration will, it is believed by competent legal authorities, have the effect of exempting them from the Federal income tax. In addition to this, it will be urged that the Legislature authorize the direct investment of State funds by the Comptroller in the purchase of Land Bank bonds, whenever these bonds are issued in response to the mortgage money requirements of the various savings and loan associations of the State. These bonds would be issued only up to $20,000-000.

"The effect of this legislation undoubtedly would be a great and immediate outflow of savings and loan association funds for the accomodation of home seekers who are now turned away. We are unable to make thousands of loans which might be easily and safely placed, much to the benefit of the housing situation and the community at large.

NO SCHEME FOR PROFIT

"The plan involves no increase in the

DRAWING MATERIALS

BLUE PRINTS

tax burden of the people, nor is it a money making scheme, for no individuals will make money out of it. It insures the return of the moneys invested, with a substantial rate of interest, so the State Treasury would gain. The sum dedicated by the Legislature for this worthy purpose would form a revolving fund for the encouragement of individual home-building, provided that the Comptroller was authorized—as he should be of course—to invest the repayment of bond money in new bonds. As the bonds would be issued serially for periods of ten years (one-tenth maturing each year), the Comptroller would have available for reinvestment about $2,000,000 every year. The fund would renew itself every eleven years."

So far as Philadelphia is concerned, Daniel Crawford, president of the Philadelphia Operative Builders' Association, is preparing a programme, calling for the the erection of $50,000,000 worth of new dwellings next year. This will mean a partial relief, only, however, and it will take yearse of continuous work to bring this city up to its standard in the matter of homes.

* * *

SENTIMENT in favor of the "open shop" has been growing apace, and with the impetus received from the great "open shop" movement carried through so successfully in Seattle, has spread rapidly through the country. General Atterbury, vice president of the Pennsylvania Railroad, recently advocated the open shop without prejudice against trade unions, and asked for expression of opinion on this vital subject from Chamber of Commerce bodies. In answer to this invitation, Ernest T. Trigg, of the Philadelphia Chamber of Commerce, replied that:

"The Philadelphia Chamber of Commerce already has come out squarely in favor of the points in the industrial situation that were emphasized by General W. W. Atterbury in his statement to the National Industrial Conference Board."

Some time ago the Philadelphia Chamber of Commerce took its stand in no half-hearted way in favor of the open shop and many of the points raised by General Atterbury.

"We have gone farther than this. The Industrial Relations Committee of the Chamber of Commerce has obtained the services for a time of George W. Cartright, of California. He has been in Philadelphia for several weeks making a careful survey of the situation and his public statements regarding conditions have had the entire approval of our organization.

"He has addressed a number of prominent organizations upon the subject and it appears that his views and those expressed by General Atterbury are similar in many respects.

"We are doing all in our power to bring about a friendly understanding of conditions between employers and workmen throughout the city and it seems as if many of our efforts have been successful. We wish to have real co-operation established here. Mr. Cartright lays great stress upon the necessity of personal contact between an employer and the men in his plant.

"General Atterbury and other business leaders recognize that there is need of plain speaking and an education of workers of all kinds as to present conditions. His suggestion that leading commercial organizations should go strongly on record is timely. Our Chamber of Commerce has done so."

Not only, however, do Chamber of Commerce bodies favor the "open shop" plan, but workmen in many instances, are in favor of it. In answer to an attack by Samuel Gompers,on employers favoring the open shop principle, C. Wilbur Miller, president of the Davison Chemical Company, Baltimore, makes this very convincing reply in the *Manufacturers' News.*

"Mr. Gompers assumes, first, that he, as President of the American Federation of Labor, represents and speaks for the workingmen of the United States; and, second, that all employers are only thinking of themselves in approaching questions relating to labor. There is not the slightest foundation for either assumption, and it is because Mr. Gompers spends part of his time with the American Federation of Labor officials, who make themselves believe these conditions exist, and the rest of his time trying to convince the politicians his assumptions are correct.

"It makes very little difference what Mr. Gompers or his official family believes, but the American public and politicians should know that the American Federation of Labor only represents a very small minority of workingmen, and many of this number are aliens without the suffrage. The employers represent the majority of American working men, and when they vote for the 'open shop' they cast the vote for this majority, as it is in this way they can be heard. If they did not vote for the 'open shop' they would all belong to the American Federation of Labor and there would be no discussion on the subject.

"Some months ago a committee of men from one of the plants I represent came to me with the complaint that the American Federation of Labor was turning the public against the workingman, and that they felt it was time for the employers of non-union labor to defend them and act

(Continued on Page 998.)

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Products of Experience

SIXTY years' experience in the roofing business has given The Barrett Company a thorough knowledge of the roofing requirements of contractors and builders as well as owners.

Barrett Everlastic Roofings are the result of this experience and knowledge.

They enable you to roof a building artistically, yet at low cost.

They return you a good profit on the job.

They give owners full and complete service-satisfaction, because they are the most durable roofings made.

Barrett Everlastic Roofings are made in four styles, which means that they are perfectly adapted to any and every type of steep-roofed building.

Everlastic Multi-Shingles

(Four Shingles in One)—Tough, elastic and durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look exactly like individual shingles and make a roof worthy of the finest buildings. Weather- and fire-resisting to a high degree. Need no painting.

Everlastic Single Shingles

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size, 8x12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof, and costs less per year of service.

Everlastic Slate-Surfaced Roofing

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Requires no painting. Nails and cement included.

Everlastic "Rubber" Roofing

This is one of our most popular roofings. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

SHEETROCK

The Fireproof Wallboard

Makes "Winter-Profits" for Contractors

Carpenters and contractors can increase their earnings this Winter by showing building owners the special adaptability of Sheetrock for alterations and repairs. For instance, think of the private garages which the owners would like to have lined with this fireproof, heat and cold-resisting material!

Then, too, there are innumerable places for Sheetrock in the home, a billiard room, a children's playroom, a spare bedroom in the attic; a furnace room or laundry in the basement, as well as remodel and repair work generally. For walls and ceilings in stores, offices and factories, Sheetrock has special advantages.

Made from pure gypsum rock, encased in a heavy protective covering, Sheetrock is fireproof. It cannot warp, shrink, buckle or crack. It resists heat, cold and sound. It is easily and quickly nailed to studding and joists. It takes any decorative treatment, paper, tint, paint or panels.

Why not make these many Sheetrock uses and advantages increase your bank account this Winter? We fill your orders promptly.

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long
A Complete Line of Moulding and Studding to be used with Sheetrock

as their spokesmen. Knowing that they threw into the bay a walking delegate who had the courage to enter our works to organize them, I sought their reason for their strong opposition to the unions. They were as follows:

"First. They strongly objected to the tyranny and selfishness of the labor union leaders.

"Second. They objected to being put upon the same level of less efficient or more idolent men.

"Third. They were indignant at the strife and hard feeling being stirred up between employer and employee and the general branding of the employer as a scoundrel and discredited person. They knew most employers were once laboring men and they hoped to be themselves or were educating their children to be employers and had no intention of tearing down their goal.

"Fourth. They felt the contact with the employer direct was more satisfactory and brought quicker and better results than through a medium which considered its own ends first and the men second.

"Fifth. That men out of the union got better wages and were much more contented. They looked upon the employer as a friend and leader and enjoyed working with him, instead of begrudging every service, knowing nothing individually counted.

"Mr. Gompers does not want to admit these facts. He found out in the steel strike a majority of workingmen wanted an 'open shop.' He knows that his power has only come from augmented governmental control by frightening the timid politician with his soap bubble. Mr. Gompers realized some time ago that the majority of the workingmen were with their employers and that if they all worked

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

together in political mattters the union would be an empty shell . It was for this reason that legislation was constantly directed against the employer to discredit him. Why cannot the politician remember the election between Mr. Bryan and Mr. Taft? Mr. Bryan accepted the plank on labor, of better labor unions, as written by Mr. Mitchell, and the A. F. of L. advocated his election, and yet Mr. Bryan got less votes than he ever received before.

"Put a labor union plank in the platform of either party and the majority of laboring men will vote against that party.

"The majority of workingmen, the majority of employers, the majority of professional men, the majority of salaried men, and I believe, the majority union laboring men if they could speak their minds, believe in an 'open shop', and all these classes are just as interested in the betterment of mankind as a few men who make a living misrepresenting the laboring man and the country.

"It is quite time that men representing the majority of men in this country who work with their hands and skill come to their defense. Most of the men employed at our works are my personal friends and I represent them when I speak on this subject or vote at the National Chamber of Commerce. If I did not, they would choose Mr. Gompers by joining the union. They all know I voted for the 'open shop' and they all back it up, as do the employees of the other members who voted the same way."

DEFINING RESPONSIBILITY

OBJECTIONS TO RIGID CLASSIFICATION

BY E. T. THURSTON

Secretary, General Contractors of San Francisco

The Bulletin has suggested and advoccated that contractors be classified according to financial responsibility and business experience as a means of contributing to the welfare alike of the public and the contracting profession. The points of view, respectively, of the head of a large construction company and the editor of a magazine appear to the writer to involve a certain lack of appreciation of the basis of the building business. In this belief the writer is prompted to offer the following remarks:

Every contractor invited to bid on a job has the right to expect an equal chance with every other contractor. This necessiarily involves (1) absence of prejudice on the part of the owner and (2) identical terms and conditions for all bidders. It is the private owner's privilege to include or exclude bidders at will, but some general, impartial way of selecting desirable bidders must govern public work. In either case the fact that a contractor is officially invited or permitted to bid should be considered *prima facie* evidence of his desirability as contractor for the work from the standpoint of the owner. This means no less than that the lowest regular bidder is entitled to the award of the work, provided, of course, he be able to qualify by signing a proper contract and furnishing the neccessary bond or other security. Any owner, having received competitive bids, who refuses to award the contract to the lowest bidder competent and willing to qualify as such is guilty of misrepresentation and fraud, unless the aforesaid low bidder is given suitable compensation for his estimate.

CLOSE BIDS TO UNRELIARLE CONTRACTORS

Having disposed of these ethical fundamentals, let us consider how bidders may be intelligently selected:

For public work, it is submitted that the only measurable responsibility is financial responsibility, whereas for private work the personal element and the matter of professional and business reputation may properly be considered as even more important than large material resources. In fairness, we see no escape from the universal practice of insuring the responsibility of a bidder on public work by requiring of him a bidder's bond or a certified check. If previous experience with a proposed bidder has resulted in prejudice against him on the part of the public body, the public should have the same authority to refuse him the privilege of bidding as to refuse to award him the contract if his bid is low, and the former procedure would surely be more ethical than the latter.

There are various sources of information available to the private owner for the determination of the responsibility and desirability of any contractor whom he may have under consideration as a bidder; such as his architect or engineer and his banker. Owners and their architects and engineers should be made to realize that they may not invite and receive competitive bids from contractors without obligating themselves to award the work to the contractor submitting the lowest regular bid. By "regular bid" is meant one in strict conformity with the specifications and the call for bids.

MONEY AND LUCK OR RELIABILITY?

The writer sees no merit in the suggestion that contractors be classified according to years of experience and gross annual business. Large personal assets or sheer luck may enable a poor, inefficient contractor to continue in business many years and to carry out successfully, from the owner's standpoint, a large volume of work, whereas limited assets or misfortune may seriously hamper the business of the most efficient contractor. In general, if a contractor pays his bills, no other assumption is warranted than that his business is a financial success. Responsibility is ability and willingness to meet one's obligations. From the layman's standpoint these obligations are in fact exclusively financial. Every contractor knows that years of experience alone will never make a high grade contractor. Ability, intelligence and integrity are also needed. Every contractor also knows that no amount of ability is absolute assurance against error in estimate and bid. Furthermore, every business man knows that personal endorsements as to moral responsibilty and capability are themselves in general irresponsible and as unreliable as they are easy to get. Many years of membership in the American Society of Civil Engineers has convinced the writer that such membership has little influence in securing commissions from laymen; much less influence has one's relative classification therein.

Securing business on a profitable basis is purely a matter of salesmanship, no matter what the line. The keenest, most experienced business man and the most timid, unsophisticated member of society alike capitulate to the clever salesman.

It appears to the writer that contractors give too much attention to the matter of the interests and convenience of the owner, who would be more safely left to his own devices.

IS YOUR (BUSINESS) HOME IN ORDER?

The contractor should attend more strictly to making his own business more orderly and attractive. If contractors' organizations would study more closely the problem of developing professional pride and *esprit de corps* among their membership and less to forcing correctives down the throat of outsiders, there would result that feeling of unity and regard for the finer things of life that would do more to bring about happier business relations and more prosperous conditions than any other influence. The writer in his official capacity has found his chief difficulty in enforcing the rather simple Working Rules of his organization, not with the architect or the owner, but with his own membership. In other

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

words speaking individually, it matters not so much what the other fellow is doing as what I am doing. If each one obeys the law the entire community will be law abiding.

If any considerable number of people will form an organization to uphold righteous principles, and will then individually observe those principles and eschew business relations with those that would violate them, such an organization, even though it represented a minority in its field, would eventually establish a reputation not only for itself but for each of its members, and the public would therein find a guide to responsible service.

"Skill, Integrity, and Responsibility" are desirable qualities, but let us not ask the public to believe that they are either guaranteed or necessarily evidenced by liquid assets and mechanical equipment. Let us rather, in behalf of our boasted "equality of opportunity" and in the interest of the lay public, get away from the worship of mere money and grossness, and seek for more personal evidences of "Skill, Integrity, and Responsibility."—*"Bulletin of Associated General Contractors.*

THE BUILDER AND HIS DEALER

BY E. S. ROBERTS

A widely popular automobile is advertised as being "standardized,"—that is, the parts are brought together and assembled into a finished car. It seemed to be a new idea in the automobile field, yet it is what builders have been doing from time immemorial,—assembling materials into completed structures. Yet builders do not sell the completed structures to owners, nor do dealers sell the materials to the builders. Each is selling a service, —the builder his services in erecting a building and the dealer his services in furnishing the materials. And in the final analysis the materials are not bought or sold,—only the service they render in the completed building is sold.

Thus the furnishing and use of the proper materials to perform certain service in the building becomes as important as any other function. And part of the dealer's task is to know the proper material and how it should be used to secure the desired result; while to the builder is assigned the task of using that material so as to secure the desired result.

Perhaps one of the most serious drawbacks under which the small contractor and building supply dealer labor is a lack of understanding of each other's problems. It is up to the dealer to buy, not from the lowest bidder, but from the producers from whom he is assured of getting delivery. It is his problem to aid in getting the material into his yard, to unload it promptly and economically, to reload it to his delivery equipment and get it to the job, and all on a margin that requires the utmost skill to prevent showing a red ink balance on his ledger.

However, the troubles that delay and aggravate the dealer in turn are reflected on the contractor,—but the average small contractor is not familiar with conditions beyond the dealer's control and vents his ire upon the luckless chap who is furnishing materials.

For instance, nearly ever contractor has suffered through inability to secure labor,—yet he fails to realize that the dealer has to have labor, that the producer must have labor. Contractors have experienced delay in railroad travel, yet they fail to co-ordinate this with the much worse delay in freight. It seems that the small contractor is so busy with his own immediate troubles that he cannot or does not see that his worries are the same as the dealer's and producer's and their difficulties are only the same as those from which the whole nation is suffering. The remedy would seem to lie in a better understanding of the conditions that affect the whole building industry.

In order to secure the proper distribution of materials contractors should familiarize themselves with what constitutes a standard load and order accordingly. For instance, if 1,500 common brick constitutes a wagon load, and 2,500 a truck load, as far as possible the contractor should order those quantities. When the end of the job is in sight he should estimate carefully what he needs to complete his job, for it costs money to pick up material and haul it away. Not only that, but the team or truck that is picking up over-ordered material should rightfully be delivering, for undoubtedly some other builder is waiting.

Often a dealer is called upon to deliver material over almost impassable roads, where, if the builder had notified the dealer when the road or street was in such condition that it should bear traffic, delivery could have been made with much less expense.

A contractor should assure himself that the owner for whom he builds is able and willing to pay. Too often, the prospective owner is lax in meeting his obligations and an additional burden is thrown on the small contractor. "Shoe string" owners should also be avoided. It is true that the commercial fabric of the world is woven of golden threads of credit, yet more than a casual glance is given to the strength of these threads by the successful industries.

Money makes the mare go just as well today as it ever did, and credit men in many firms are now insisting that a man should have, besides a clean record and a willingness to pay, *the ability and means* to meet his obligations. Therefore a contractor should be alive to every means to foster his credit reputation. Not only should he see his way clear to pay his bills, but he should make certain that his clients will pay him promptly. Many a small builder has done himself damage by waiting until it was too late before taking the dealer into his confidence.

If a contractor would talk over with a dealer the advisability of taking on certain work and arrange terms before going ahead, much unpleasant controversy would be avoided. The dealer isn't anxious to collect his bills merely for the satisfaction of handling the money. He, too, has obligations to meet, and he must meet them promptly, else his sources of supply will be cut off.

Lastly, a spirit of confidence should obtain between dealer and builder. The old ideas of skinning corners and "getting by" are over, for business men know that success is not built on a single operation, but upon a continued series of tasks well and honestly accomplished. The standardization of materials is largely responsible for the elimination of trickery, and inherently most men are honest. Poor construction has largely been eliminated, and the building industry stands on a high plane of efficiency and worth. Perhaps no other industry is so affected by conditions not under its control. Certainly no other industry, unless it be iron and steel, employs so many men, or consumes so much material, or is so dependent upon railroads. Nor is any other industry so hard hit in times of panic or so overworked in times of prosperity. Building is the first industry hit in hard times and the last to recover. It goes hand in glove with financial conditions and when money is "tight" building suffers. Building is tremendously dependent upon labor.

Thus with producer, dealer and builder so linked, a mutual understanding of each others' problems should cause a more equitable use and distribution of materials and labor.—*Builders Journal.*

Edward G. MacGannon, for the past six years Designing and Estimating Engineer for Cramp and Company, Builders, is now in business for himself as Consulting and Designing Engineer, with office in the Perry Building. Mr. MacGannon is specializing in designs and estimates of reinforced concrete construction.

As The Editor Sees It

VIEWING the situation from every angle, we feel that the future outlook for the building industry is assuming a brighter aspect. The movements on foot throughout the country to start the wheels of this great and vital industry in motion, are at last producing tangible results. Then, too, there is a more settled feeling on the part of home buyers and home builders, growing out of the conviction that there can be no great reduction in building cost in the near future.

"It would be interesting to know," says the *American Contractor*, "just how the demand for building materials compares with the demand for clothing and shoes and other commodities, the prices of which have shown recessions. Surface indications are that the demand for building material has been proportionately less than the demand in other fields and yet the recessions in building material prices have yielded to these unfavorable conditions less than commodity prices. The very natural conclusion is that there has not been so great a spread between production costs and selling costs on building materials as on general commodities and that building material prices can not show the proportional decrease in prices incident to general commodities, without going below the cost of production. Here and there a hard pressed dealer or manufacturer will sell below cost in order to relieve his financial strain, but no one will expect building material or other prices to drop below producer's costs and remain there.

Lumber prices now current can not be justified and can not long be maintained at so low a figure. The least demand is likely to bring a substantial recovery and builders contemplating activities in the spring can not go very wrong by taking advantage of the persent stagnation in the lumber industry.

Brick and cement prices, over a period of thirty days, have made no substantial concessions to the striking buyers and while cheaper coal is a favorable prospect which normally would encourage lower prices by spring, our transportation situation is not at all encouraging when it is analyzed.

It is the opinion of O. E. Hawk, of Youngstown, Ohio, whom we quote from Building Industry that "the living standards in America must be maintained if we are to continue as a democracy, and should improve if we ever hope to render charity useless."

"Increase in population is, after all, the basic cause for increased demand and increased price of everything. If you held a million articles which humanity must have and it were impossible for another one to ever be manufactured, it would be folly to argue that any law, either natural or otherwise, could ever operate to reduce the value of these articles. This is practically the situation with land. Land today is as cheap generally as it can ever be."

* * *

The necessity of making mortgages paying investments, is urged in most influential quarters, and much was accomplished in this direction by the Governors' meeting held recently at Harrisburg. That the financial situation is improving is the belief of John N. McGarvey, chairman of the Builders' Executive Committee, of the Philadelphia Operative Builders' Association. Said Mr. McGarvey recently:

"I believe that the close study the public is giving to the question of providing adequate housing in Philadelphia has begun the vast process of restoring confidence."

"There are two essentials, which have been impressed on the public mind as a result of the painful experience of evictions and lowered standards of living forced upon families by inadequate accommodations.

"One is that there is a real shortage of houses running far into the thousands.

"The other is that the housing shortage can only be made up by constructing new houses.

"The fact that many banks and savings institutions all over the city are increasing the amount of their mortgage loans is one of the most encouraging signs we have had thus far, for it means that in-

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

vestors are turnng to solid substantial mortgages with their limited, but always safe return for investment.

"The signs of improvement are but a glimmer through the clouds, but they are pointing the way to relief for thousands of Philadelphia families, if we read their meaning rightly."

Mr. McGarvey declared that with a concentrated drive under way by the builders, bankers and public generally for the removal of State and Federal taxes from mortgage investments he believes the great factor in the solution of the housing problem will be disposed of.

"Financing is at the bottom of the present housing shortage." Public confidence must be solidly established as a foundation on which to build the financial frame work. A reasonable and fair return from mortgage investments must be assured the financial man, while we know there is a limit of interest charges beyond which mortgages should not go for the sake of the home buyer, who never has any too much money.

"I believe from evidence I have gathered in many directions recently that there is little chance of term loans such as mortgages, falling off in interest rates for sometime to come and therefore, believe the present 6 per cent. figure will be maintained pretty well.

"The aid lent our cause by Governor Sproul and the distinguished executives, who attended the Governor's conference at Harrisburg recently, has been inestimable and the second great forward stride is being looked forward to daily now when it is expected Senator Calder's reconstruction committee will report the results of its findings concerning the housing shortage throughout the United States and the serious social and economic problems which will result to the Nation if relief is not quickly provided."

WHAT IS A FAIR RENTAL?

A Summary Prepared from Data Compiled by the Research Department of the Housing Company

LUTHER CONANT, JR

What is a fair rental for dwelling house property?

A rule of thumb has often been laid down that a dwelling house should return a gross rental of 10% of its value. A vast amount of dwelling house property has been rented on this basis, or less. Yet it is certain that, by and large, a gross rental of 10% will not return even a savings bank rate of interest to the owner. In some cases it will return practically nothing.

Some rather careful calculations of the cost of operating a dwelling-house property indicate that, instead of a gross rental of 10%, a gross rental of at least 13%, and frequently of 15% or more, is necessary to return a yield at all remunerative.

One calculation of this sort, prepared by the United States Housing Corporation, places the normal cost of operating and maintaining ordinary dwelling-house property at nearly 8%, a figure which, in view of the general advance in taxes, supplies, and labor during the past few years, should be increased at the present time. The operating costs for apartment-house property are considerably higher than 8%.

The United States Housing Corporation's figures, which represent the median experience as reported for the period 1913—1918, and which should be taken as a broad basis rather than as a specific formula, are as follows:

Factors	Per cent. on Investment
Maintenance	1.4
Service	.5
Insurance	.2
Taxes and Assessments	1.4
Vacancies and Bad Accounts	.7
Depreciation and Obsolescence*	3.0
Administration	.5
Total Expense	7.7

On this basis a gross rental of nearly 14% would be needed to return even 6% on the investment. But it should be clear that at the present time a 6% return does not adequately compensate the owner for the burden and risk of maintaining such property.

Mr. William C. Benkert, former president of the Philadelphia Real Estate Board, has placed the operating cost of dwelling-house property at 7.1%, as follows:

Taxes and Water Rates	2.5%
Vacancies	1.0
Repairs	1.0
Insurance	.1
Management	.5
Depreciation and Obsolescence	2.0
Total	7.1%

*Estimated and assumed.

SHEETROCK

The Fireproof Wallboard

Sawed and Nailed Like Lumber, But Does Not Warp

Sheetrock, the fireproof wallboard, is of rock composition. Made by the special U. S. G. process, it can be easily sawed and nailed. Rigid, tough and durable, it retains its original shape and condition year after year.

Being a rock product, Sheetrock cannot warp, shrink or buckle. It is fireproof. Its edges have the U. S. G. Patented Reinforcement for protection in handling, for extra nailing strength and for a tight, flush joint.

Permanently and uniformly even in surface, factory-cast and factory-finished, Sheetrock takes any decorative treatment—paper, paint, panels. It is quickly and economically put up in new construction as well as in alterations and repair work. We fill all Sheetrock orders promptly.

Sheetrock is 3/8 in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long
A Complete Line of Moulding and Studding to be used with Sheetrock

(Continued from page 1004)

The allowances for depreciation and obsolescence used in the preceding calculcation may be accepted as conservative.

Practically no reliable estimate has placed the operating cost of dwelling-house property at less than 7%.

Obviously, therefore, the old rule of thumb of a 10% gross rental should be discarded. The foregoing calculations of operating costs suggest that a gross rental of 13% is a *mimimum* economic return on such property.

A gross rental of 13% means that a house and lot worth $8,000 should rent for $1,040 a year or, roughly, $87 per month; a gross rental of 15% would mean, for such a house, a rental of $100 per month.

The rental should be related to the fair current value of the property, not to its cost, which may be more or less than its value. Depreciation and obsolescence charges are properly to be computed on the original cost. But the rental must take account of the value. Any attempt arbitrarily to regulate the rental on the basis of a lower original cost necessarily means that the competition of such rentals will discourage the building of new houses on which a similar rental would not yield an economic return. The capitalist who must face such competition is forced to look to other fields of investment.

In the case of an owner occupying his house these operating costs can be substantially reduced. Thus, the allowance for vacancies can be entirely eliminated, while various other items can be modified. In the case of an "owner's rental," so called, the operating costs might not exceed 5%.

The country today is faced with a shortage of homes for at least one million families. The population is congested beyond the highest point ever previously reached. There are at present approximately 121 families for every 100 houses against an average of 115 families per 100 houses in 1915, and 112 families for every 100 houses in 1900. In view of the rapid influx of immigration, this congestion obviously must increase unless the construction of houses is speedily resumed on an extensive scale.

The question arises, however: How can such construction be hoped for if the landlord cannot secure a fair return on his investment? The simple fact is that a community cannot expect houses to be furnished unless such housing will return a reasonable profit to the builder and to the owner who purchases for investment. When an income of 7%, 8 per cent, or more, can be secured from gilt-edge securities, it is unreasonable to expect that business men will undertake the burden and expense of building and operating dwelling-house property for 2 per cent., 3 per cent., or 4 per cent., which fairly expresses the return in a large number of cases.

Undoubtedly, there have been many instances of flagrant profiteering in rents, and no excuse should be offered for a greedy landlord or—and he is, perhaps, more often the real culprit—a grasping sub-lessor. But the investigations of nearly all official commissions agree that, in a vast majority of cases, increases in rent, instead of being extortionate, have been moderate; in many cases they undoubtedly have been inadequate. In the face of sensational increases in building costs and heavy increases in operating expenses, rents in general have risen very slowly. Thus, reports of the United States Bureau of Labor Statistics show that, while the cost of living as a whole increased 97% between 1913 and December, 1919, the average increase in rents was only 30%. Likewise, studies by the National Industrial Conference Board show that, whereas the increase in cost of food between July, 1914, and July, 1920, was 119%, that in clothing 166% and in sundries 85 per cent., the average increase in cost of shelter was only 58%.

These figures reflect one of the fundamental factors in the present housing crisis, namely, a stubborn resistance to any increase in expenditure for one of the prime necessaries of life, shelter, in the face of the most extravagant expenditure for such articles as silk shirts, silk stockings, rugs, and a hundred and one other luxuries. It is axiomatic that capital seeks the maximum rate of return, and so long as it can command double the return in the production of luxuries that it can secure through the production of housing, the present housing shortage will be unrelieved. In each case the cure for an undesirable situation is really in the hands of the consumer.

That houses will be built when the financial return is adequate is shown by the fact that, although housing in many localities came almost to a standstill, the erection of garages reached unusual proportions. Thus, whereas in 1919 only 33 tenement houses were built in Boston, 606 garages were erected at a cost of over $5,000,000. Building statistics of other cities for the current year show similar conditions. Had the erection of dwellings offered the same rate of return, there can be no doubt that builders would have been equally ready to undertake their construction.

This, then, is the crux of the housing problem, and it will not be solved permanently by any number of new legislative acts, new city ordinances, or court rulings. It will be solved permanently only through such a readjustment of rentals to real estate values as will again automatically attract capital to the building industry. So far as this readjustment can be affected by a reduction in building costs, this is highly desirable. But the readjustment must be made. And it will be made most effectively and with least friction if the tenant will distinguish between rents which are exorbitant and those which are reasonable.

INDUSTRIAL CO-OPERATION IN BUILDING

D. KNICKERBACKER BOYD

The most vital step to be taken in the building industry today is to bring the workingman, the employer, the representatives of building owners, the architects and the engineers together in a co-operative spirit, in the opinion of D. Knickerbacker Boyd, Philadelphia architect, who was recently appointed member of the Pennsylvania building code committee and who has been acting as spokesman for nearly 70,000 workmen, members of the Council of Associated Building Trades of Philadelphia and the Brotherhood of Carpenters and Joiners.

"We should consider that the interests of each group are common to all," explained Mr. Boyd, "and instead of having labor discuss hours, wages, strikes and labor problems by themselves, these matters should be taken up with the builders, architects and others who in the end, like the workingman, serve the owners and the entire community.

"With this idea in view I went before the Council of Associated Building Trades of Philadelphia and Vicinity and told them that by bringing into contact with these men the employers in their own and related fields and technically trained men from educational institutions,

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

allied industries, associations and professions and national, state and municipal departments, they would become more familiar with the materials with which they worked and the tools and traditions of the craft.

"With such increased knowledge and enthuiasm journeymen would become not only more interested and efficient mechanics, but better citizens.

"After talking to the council, various committees of workingmen waited on me and brought to my attention the difficulties of attracting young men into the building trades. They said they were handicapped by the fact that the working hours of a tradesman of that sort are shortened by bad weather and exposure, and that many young men were going instead into clerical and commercial pursuits and shops. Fathers who had spent their lives in the trades were discouraging their sons from such arduous callings.

MUST IMPROVE CONDITIONS

"This whole situation would be changed by inculcating in journyemen a greater joy in their daily tasks by means of the co-operation sought.

"These conferences with the workmen's committees led to the establishment of classes on plan-reading for bricklayers and addresses on various subjects before the unions. The result of all this was that I was asked to be spokesman for the council and for the Brotherhood of Carpenters and Joiners.

"We made a proposition to the industrial relations committee of the Chamber of Commerce which is now being laid before the different builders' organizations.

"Acting as spokesman for these 70,000 workers in the building trades, I laid this proposal before the Chamber of Commerce:

" 'Labor does consider that it is of great importance to have the active co-operation of the employers in developing the human-interest side of industry and the technical phase of craftsmanship. Labor feels also that the employers should not leave to it alone the onus and responsibility of bringing into each branch of the building industry that young blood, brawn and brains which should be attracted through appreciative interest and the means of intelligent choice into these trades, and diverted from less strenuous, health-building, manly occupations. It therefore requests the active support and co-operation of employers in encouraging young men to enter the ranks of the building trades and in providing the instruction, training and practical experience requisite for apprenticeship.

" 'In making this request we desire to emphasize the fact, apparently not heretofore recognized by the majority of the employers, that those employed in the building trades are actually entitled to the assistance and co-operation of employers in securing, training and perfecting the human raw material out of which workers in these industries are produced, and in making of the material more genuinely interested and efficient mechanics, workers and citizens. To this end we further request co-operation in providing additional means of interesting and informing the journeymen already in the trades and crafts. This relates not only to those men in labor organizations at their regular meetings through lectures, illustrated addresses and informal talks, but to all the men in shops, in the field and on the job through furnishing the means of more intimate contact with their foremen and employers—and with the architects or engineers whose directions and desires it is aimed to follow.

" 'For years those employed in the building industry have been giving their time, energy and means—almost alone so far as employers collectively are concerned—to develop their organizations as instruments of service in their respective branches. If mistakes have been made, we feel that this is all the more reason why we should have the fullest co-operation of employers and of architects and engineers in the satisfactory solution of all problems.

" 'We therefore invite and request representation of employers or of their organizations and of architects and engineers at regular meetings of labor organizations or at meetings of workingmen where not organized, to take part in discussions and movements for the betterments of service on the part of the employed and of conditions surrounding their employment, and perhaps their living accommodations. This requirement is stipulated in order that workingmen may have the benefit of the knowledge and experience of those others interested in the welfare of each industry, so that all may serve the general public to the best of their abilities.

" 'This is stipulated also in order that these other elements in the building industry may be afforded the opportunity, through closer contact with workingmen, to understand their aims and aspirations. Also in order that such representatives, in addition to assisting, through this participation, may be in a position to report to their organizations or associates what present activities might, in their opinion, be discontinued, increased or improved upon through that intelligent constructive criticsm heretofore lacking by reason of the absence of opportunity to secure first-hand knowledge.'

"In conclusion I would like to repeat the watchword given by Senator Cartwright at a mass-meeting in the Academy of Music several nights ago: 'Let's stop fighting and start figuring.' "

THE FLAT FEE AS A MEASURE OF EQUITY

By John Lawrence Mauran

About ten years ago one of our most loyal and important clients came to us with an alteration and remodeling problem involving a considerable expenditure compared to the result he was seeking. He was, as we well knew, a timid man in matters wherein architects feel they are on their home grounds, although bold enough in the financial and real estate field. The exigencies of time and the character of reconstruction led us, as a condition to fulfilling his wishes, to insist on the selection of a certain contractor on a cost plus basis, and in spite of the fact that in those good days now gone by the "cost plus" had a definite limit of liability of about two hundred thousand dollars, our client showed his timidity by hesitating over the indefinite amount of our fee of ten per cent. Although we could hardly fathom the causes of hesitancy, the inspiration of the moment led us to suggest that we would do the work—whatever it might cost—for a flat fee of twenty thousand dollars. With unmistakable relief he seized upon the suggestion and everyone was happy even upon the day of completion a week ahead of time and with a saving of over seventeen thousand dollars. There is a psychology in it, for in spite of paying us some seventeen hundred dollars more than ten per cent. he had found security against the bugbear of increased costs involving increased architects' fees.

Now every architect worthy of the name would hotly repudiate the implied suggestion of bad faith, but we must remember that often the client's mind visualizes added fees with any suggested betterment, no matter how high his confidence in the disinterested character of the suggestion.

From the deep impression left on us of the satisfaction of the owner we profited a little later on when he retained us as architects for the first reinforced concrete building of any importance in St. Louis. It was an eight story wholesale building covering an entire city block and at an early stage in the negotiations, we

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

perceived symptoms which led us to repeat our offer of a flat all-inclusive fee.

Our attitude through both these experiences was a more or less passive acceptance of the state of mind of a client, but quite recently we caught again the same note in the comments of clients during preliminary conferences, sounding a vague alarm as to skyrocketing of the fee in case of a pyrotechnic display in building costs.

This turned our thoughts to the two previous experiences, and changed our attitude from a passive one to an active advocacy of the fixed and all inclusive fee, and late in 1919, when the material market had all the symptoms of an ascending escalator, we expressed our desire to fix in advance the *exact obligation of the client* for full architectural services, including the fixed fees, which we in turn agreed to pay the engineers engaged by us on work in their various branches.

Of course, the percentage system applied to the estimated cost furnished the basis for determining the fee named, but the fact that it was *fixed* gave our clients every assurance that their interests were paramount, and hence while we were bending every endeavor to protect them against spectacular advances, there could be no possible ground for even the unformulated suspicion that we, too, were profiteering at their expense through the unpreventable increases in cost over the already high level of the moment.

While there was a certain amount of surprise expressed, there were unmistakable signs of appreciation of what commended itself to them as to us, as a business-like co-operation insuring justice to all concerned, for the surprise centered about an unsuspected flexibility of the architect's mind in his methods of calculating his remuneration.

It may prove of interest to record the rather unusual method we adopted in the handling of these commissions under very trying conditions. First of all we urged the immediate *selection* of a contractor of proved ability in the particular type of work, of absolute integrity and whose conditions of other work in progress at the moment justifide such a step.

We further assured our clients that they could engage such a contractor to perform the work at cost plus a *fixed fee.* We also pointed out that in the purchase of material long in advance of the preparation of plans and specifications, that the logical method of handling such an undertaking was through the functioning of a "Committee of the Whole," consisting of owner, architect, contractor, the owner's operating engineer or manager and the architect's engineers (structural, mechanical, electrical, etc.) sitting together with one common purpose to discuss, decide and act on every matter whether to purchase or the choice of methods and materials.

Another phase of "all-inclusiveness" as pertaining to the architect's fee (however arrived at) is the oft-time unspoken objection in the client's mind to the little understood separate payment of the clerk of the works, as well as the engineers. One of our clients voiced this feeling recently when he blurted out "we paid for your superintendents on the last job." From our recent experiences I can vouch for the fact that while we have been fully reimbursed, our clients' satisfaction in the "all-inclusive fixed fee" has fully justified its adoption.

In looking back over the operation of the "Committee system," the application of the "fixed fee" to sub-contractors as well as the general contractors, and especially to our own own "all-incusive fixed fee" for architectural and engineering services, there were many occasions which spring to mind when we were thankful, indeed, not only because the disinterested character of our services excluded them from the often trying discussions over jumping prices, but more particularly because of the comfortable feeling that while we were being adequately paid for the service renderd, we were not profiting by the misfortunes of our clients, and so we feel that we can conscientiously commend to the profession and to our future clients, "the flat fee as a measure of equity."—*Journal of American Institute of Architects.*

"FRAME CONSTRUCTION DETAILS

Frame construction, unlike the various other types of construction used in the erection of small buildings, has grown from various miscellaneous types which were developed by necessity in the days of the pioneer settlers into three distinct types: "balloon frame," "braced frame" and "western frame," each of which predominates in certain sections of the country.

A book entitled "Frame Construction Details," which has just been issued by the Architectural and Building Code Service of the National Lumber Manufacturers Association, shows fully the proper use of lumber in the three types. No attempt is made to establish any one of these three types as ideal and standard. This would be inadvisable and impracticable at present, as each type has developed desirable features which would not be satisfactory in combination with another type.

Various principles of economy in design and safety in construction of frame buildings are illustrated in "Frame Construction Details," as well as specific methods of fire stopping and of decreasing fire hazards.

It is the hope of the National Lumber Manufacturers Association to introduce the book into architectural schools and colleges, where there has been strong demand for such information. It is also being introduced to building inspectors, architects, engineers, draftsmen and lumber manufacturers and distributors.

* * *

COMMENDATION OF LUMBER PRICE REDUCTIONS

The most important phase to the lumber industry of the recent hearings of the U. S. Senate Committee on Reconstruction and Production, was the favorable attitude of the Committee toward the industry and its commendation of the fact that the lumber industry has taken the lead among manufacturers of building materials, in price reductions. The Committee has just completed hearings in many of the important cities of the country from New York to Denver, to Birmingham.

Testimony in many places and many instances was given to the effect that throughout the lumber industry, in both hardwoods and softwoods, prices at the mills had declined from 35% to 50%.

Specific instances, related again and again, confirmed the oft-repeated general statements that the housing needs of the country are tremendous and the situation in some sections is most serious. Inadequate transportation service, difficulty of obtaining banking and credit facilities, labor shortage and inefficiency, together with relatively high costs of materials and labor were the reasons given for the housing shortage and tie-up of construction. These conditions were described in most of the cities visited by the Committee.

In connection with their commendation of the lumber industry in taking the lead in price reductions, the Committee urged other industries making building materials to follow the lead of the lumbermen in bringing prices to lower levels.

The Philadelphia Builders' Exchange will resume its weekly luncheons Thursday, December 16th, at 12.30 P. M., at the Builders' Exchange Building, 18 South Seventh street.

Mr. W. H. Hutt, Deputy Governor, Federal Reserve Bank, will address the meeting on "Federal Reserve Banking System as It Relates to the Business Man."

As The Editor Sees It

THE current of optimism, which we commented on in the GUIDE last week, is still running through the building field. Conditions are becoming more settled; prices are being stabilized, financial difficulties are nearer a solution and the whole question assumes a brighter aspect.

Architects, during the past year, have figured on a great deal of contemplated work, much of which has been held in abeyance until financing building is possible, and the feeling expressed is that this work will be taken up very soon after the new year.

S. W. Straus & Co., New York bankers, comment on the building situation as follows.

"Although the processes of liquidation now in progress have brought recessions in the prices of nearly every commodity of life, it is of the utmost significance that rents have not receded generally and that the tendency of prices for housing accommodations is toward higher levels, thus making more substantial the income from property.

"It is also noted that a well-defined sentiment against a higher interest rate than 6 per cent. for first-class real estate mortgages is making itself felt.

"Unquestionably, a far-reaching and permanent readjustment of income from real estate investments is taking place. It is a fact generally conceded that in many instances and localities income from improved property previous to the war was too low. Estates and large holders of realty in such cases were not able to secure a return commmensurate with the income derived from many other forms of investment.

HELP FOR HOUSING SITUATION

"An indefinite continuation of those conditions would mean a slowing down of the building industry; and the present readjustmets of rental incomes, therefore, is a very favorable indication and will help the entire housing situation and real estate market.

"While there has been a great amount of public agitation against the present range of rents, it must be borne in mind that any conditions or influences, whether they be legislative or economic, which have the ultimate effect of diverting capital from building investments to other channels, simply impose additional hardships on the public in the long run.

The law of supply and demand must hold full sway in the final analysis. Property rights must be safeguarded, and if the nation's housing conditions are to be restored to normal everything possible must be done to encourage the flow of capital through those channels of investment and not divert it elsewhere through adverse legislation which would stop progress, or through unsound financing brought about by too high interest rates on real estate investments.

Earl F. Stokes, Builders' Exchange, Erie, Pa., believes that now is the time to build and says, according to the *Builders' Journal*:

Although prospects for building are not very encouraging in this section of the country at the present time, and from present indications there will be more men looking for work in the building trades lines, this winter, than any time since 1912, it does not always help to fall in with prevailing views.

One large contractor in this vicinity says that now is the opportune time to build. We can get the pick of skilled mechanics, much of the material we had difficulties in getting can be supplied now at a lesser price than three months ago and with the transportation problems fast clearing up conditions are more favorable than they will be next spring when there will be labor shortage and another possible shortage of materials and a greater congestion of transportation. This contractor is correct and the public should be informed of these conditions through the Chamber of Commerce and the Build a Home Campaign Committee in every city.

In a report made a few weeks ago at a convention held in Detroit, it was stated that the replies to a questionnaire showed a decrease in production from 8½% to as high as 31%, regardless of the fact that the same questionnaires showed an increase in wages from 10 to 32% over

BLUE PRINTS

1918-1919. In one city with a population of only 95,000 an increase of wages amounting to $876,500 has been granted to the building trades industries alone over what they received in 1919. The public pays this bill, yet it cannot understand why building operations run so high.

* * *

"The American Society of Heating and Ventilating Engineers will hold the Professional Sessions of its Annual Meeting in the City of Philadelphia on January 26-27-28, 1921.

This is the first time since the Society was formed in 1894 that an Annual Meeting has been held outside of New York City, and it has been made possible by the indomitable efforts on the part of the Eastern Pennsylvania Chapter of the Society which is affiliated with the Engineer's Club.

While the local Chapter was only organized in 1916, it has increased in membership and activity to the point that it is now the largest of the eleven Chapters and the preparation for handling the meetings and entertainment of the members has been taken hold of in characteristic Philadelphian manner.

The Bellevue Stratford Hotel has been selected as Headquarters where the meeting will be held in the Clover Room and where a reception will be held on the evening of January 25th, to welcome the visitors who may come in advance of the meetings.

The Banquet which will take place on January 27th, also in the Bellevue Stratford, promises to be quite pretentious with prominent speakers representing The State, The City and The Industrial Interests, while several novel features will be introduced.

The Engineers' Club, through it's President, have issued an invitation to all members of the Society to avail themselves of the privileges of the Club during their stay in this city and the Society and Chapter extend to all members of the Engineers' Club an invitation to attend the meetings which will be of unusual interest to those having a knowledge of Heating and Ventilation.

The American Society of Heating and Ventilating Engineers maintain a Research Bureau at the Bureau of Mines at Pittsburgh, and are making great strides in this department of the work. In order that all members and contributors to the fund may become more intimately acquainted with what is being done toward the advancement of the Science, arrangments are being made to have a special exhibit of the devices in use and with charts and diagrams showing the results of tests.

The director of the Bureau and his associates will be on hand to explain the details of this department and will take part in the discussion of the papers which will be read during the week.

With the co-operation of the Engineers' Club and the Philadelphia Chamber of Commerce, the Eastern Pennsylvania Chapter feels that this will be one of the greatest Engineering Meetings held in Philadelphia and hope to make it the greatest meeting of the Society."

SOLID BRICK ECONOMICAL AND EVERLASTING

To most people the building or buying of a house is an investment of the first magnitude. Very frequently a man's entire lifelong savings are represented in his home, and in case of sickness or misfortune his ability to raise money will depend entirely upon its selling or loanable value. A man should set about acquiring a house with as much care as he used when he picked his wife.

The wise man will ask "Will my investment, represented by my house, yield a fair return? How much will its value decrease, year by year, through wear and tear? What will be the cost of its upkeep? If I ever have to sell it, how much will it be worth? If I ever have to raise money, how much could I borrow on it?" He will also ask "Is it going to be comfortable to live in? What are the chances of it burning up and burning me out?"

These are all pertinent questions, and the answer to every one of them depends upon the answer to another question "Of what material will your house be built?"

Solid brick has many claims to the attention of every class of prospective builder, and the first and strongest of these claims is *economy*. We will prove that solid brick, though the most distinguished of all the building materials, actually saves dollars and cents to the man who intends to be his own tenant, or who is building as a means of providing an income, or who is a renter; also it makes a bigger profit for those who build to sell.

Brick is one of the most beautiful of building materials, and one in which all kinds of architectural designs may be easily conceived and carried out. Those who have traveled in the old world probably remember the charming houses and villages of brick, centures old, which seem only to grow more mellow under the hand of time.

Even in this country we may point with satisfaction to landmarks such as Independence Hall, Philadelphia, built of solid brick in 1729, and still in perfect condition. Another solid brick structure is the little house in which Betsy Ross made the first American flag. Then there is the

The annual vaudeville and smoker of the Exchange will be held on Friday, December 31st, at 2 P. M.

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

SHEETROCK

The Fireproof Wallboard

Quickly and Economically Put Up

Ease in handling, and rapidity and economy of application on new construction, alterations and repairs make Sheetrock jobs highly profitable.

Sheetrock—made from rock by the special U. S. G. process—is strong, tough and durable. It can be sawed like lumber and can be nailed securely to the studs or joists. Its edges have the U. S. G. Patented Reinforcement for protection in handling, for extra nailing strength and for a tight, flush joint.

Being made of pure gypsum rock, Sheetrock cannot warp, shrink or buckle. It is fireproof. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels. It is delivered in standard units of uniform thickness. All orders are filled promptly.

Sheetrock is ⅜ in. thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., December 14, 1920. Sealed proposals will be opened in this office at 3 P. M., January 6, 1921, for furnishing the labor and certain materials required in the construction (except mechanical equipment) with certain materials that will be furnished by the Government, of a frame laundry building for the United States Marine Hospital at New York, N. Y. (Stapleton). Drawings and specifications may be obtained from the Supervising Chief Engineer, Room 731, United States Custom House, New York, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

AS THE EDITOR SEES IT

(Continued from Page 1020.)

famous old state house of Boston, Faneuil Hall. And don't overlook the tiny home of William Penn, or the many small brick inns of the Jersey and Pennsylvania early settlements; not to speak of the many charming old brick houses of Virginia.

Considering that the vast majority of buildings erected in America were built of wood, and that most of the older buildings were constructed of massive timbers from hard and now almost priceless varieties of lumber, such as walnut, etc.;—in spite of this, what proportion of those innumerable wooden buildings are now left as relics of the early, bygone days?

Now and then a wooden building of historic interest stands apparently defying time, but like Mount Vernon, which is being cared for as a greatly loved heritage, there is constant tinkering and replacing.

Yet Europe, in spite of devasting wars which have swept over it every hundred years or so, can show examples by the hundred thousand of ancient solid brick buildings still fulfilling the functions for which they were designed; so many examples that the photographs of all of them would fill a great library. Every class of building is represented, from the cottage of the poorest to the castles of the rich.

Consider how microscopical is the rate of depreciation on these buildings, and remember that their brick walls have required no expense for upkeep. Compare them with a typical frame building, which is a liabilty from the moment it is finished. As soon as the carpenters have driven the last nail the buliding begins to decay—a process retarded with difficulty and at great expense by painting the surface every few years. In a short time this wipes out the slight difference in first cost between brick and frame.

The slogan "Save the surface and you save all," advertised extensively to sell very excellent but expensive paint for frame buildings, does not interest the builder in solid brick. He doesn't have to spend a cent in order to "save the surface." He got an everlasting surface when he bought his brick.

Lumber has advanced so much in cost that at Chicago prices at the time of writing, 100 square feet of 8 inch solid brick exterior wall laid in lime mortar, furred and plastered inside, costs less than 100 square feet of exterior stud wall, covered with siding and plas-

tered inside. Solid brick may soon be lower in first cost than frame in any part of the country.

As the years pass, solid brick does not get that ancient, weatherbeaten look that your old frame houses cannot help acquiring, no matter how often you paint them. Age has a gnawing tooth for frame, but bites at solid brick vainly.

Statistics show that a brick house has about three times the life of a frame house. That is why the subject of depreciation is such a serious one for the building owner. We quote the opinion of one of America's foremost appraisal engineers—John J. Thomas, of the Lloyd-Thomas Company, Chicago. Mr. Thomas, secretary of the company, said in a speech at Cleveland that the building committee of the Chicago City Council, when considering the extension of the fire limits of Chicago, called in well-known architects, prominent insurance men, the Chief of the fire prevention bureau and appraisal engineers to give their opinions.

Mr. Thomas said, "These experts proved that the time had passed when tinder-box frame construction had even the paltry merit of being cheap. Its first cost is slightly—very slightly—less than that of solid brick, but its depreciation is so rapid and its cost of maintenance so great that even without a fire the frame structure 'would eat its head off' in a comparatively few years, while a solid brick building lasts, with a minimum of repairs, year after year.

"In appearing before the committee we showed what this factor of depreciation had done to different types of construction of every building in a city of 100,000 inhabitants, which we have recently appraised.

"In the better residence district the average depreciation of brick dwellings was less than 5 per cent. The average age was approximately nine years.

"In this connection underwriters and engineers agree that a well constructed solid brick building does not depreciate in the first five years after it is built.

"The average age of the better class frame residences was approximately fifteen years. We found an average depreciation of 30 per cent.

"Constrasting the two types of construction on a basis of equal periods of time, we found that frame buildings had lessened in value three times more than brick buildings. Remember that depreciation is a permanent exhaustion of values that is taking place in property, and not a market decline. The actual depreciation showed this startling fact; Frame property costing new a million dollars, at the end of 15 years had a sound depreciated value of only $700,000.

"If this same million dollars had been invested in brick construction, at the end of 15 years it would have a sound value of $900,000.

"This means a direct loss of $200,000 to the property owners whose money was invested in frame. Remember that this loss does not include the additional increased expense of insurance, upkeep, etc. This loss is due solely to difference in depreciation, *a force over which no human has control. The actual depreciation of brick buildings showed that they had a serviceable life of* 80 *to* 100 *years, while that of frame was* 30 *to* 40 *years.*

"Considering the fire risk phase," Mr. Thomas continued, "It is a well known fact that the fire loss ratios in European countries are much less than here. The main reason is that there is practically no frame construction to be found in any of those countries.

"Insurance companies do not care whether your property is brick or frame; they are selling insurance on all kinds of property to make money. The rates on frame construction range from 2 to 3 times greater than that charged for solid brick.

"For more than one hundred years they have carefully compiled statistics. From these statistcs they say that your chance of a bad fire is from two or three times as much if you use all frame construction than if you use solid brick."

Salvage

In the matter of salvage, every test is in favor of the better materials. The losses in solid brick are generally confined to the building in which the fire occurred. On the contrary fires in frame buildings frequently destroy not only the building in which the fire started, but adjacent buildings as well.

Mr. Thomas told of an actual salvage test made by the burning of two cottages —one of frame and the other of solid brick—in Grant Park, Chicago. Twenty thousand people witnessed the test.

The cost of the frame house was $529.00. The cost of the solid brick house was $640.05 or only 1.6 per cent. more than the frame. The insurance rate on the solid brick house was 20c per M., and on the frame house 50c per M., or 150 per cent. more than on the brick.

"After the fire," said Mr. Thomas, "we appraised the salvage and loss. The solid brick cottage was structurally intact. The doors and window frames were charred and required replacing. The partitions and trimmings were burned, but the essential features of the cottage were as good as ever. We estimated the salvage at 80 per cent. and the loss to be $128.00.

"We found the frame structure was a wreck for all habitable purposes, about the only salvage being the brick chimney.

"A solid brick house is more comfortable, easier to warm in winter and cooler in summer.

"It saves fuel and again saves money.

"It is safer from conflagration—safer from windstorms.

"The real reason for the use of frame in the early days was its abundance, convenience and its cheapness; the real reason for its use today is the well known force of habit. There is no other reason. This is the age of solid brick.

"Data shows that solid brick saves money—that upkeep and insurance costs are less—that a solid brick building not only lasts a man's life time, but will be a good home for his children and his grandchildren instead of becoming worthless in his own life time—that the property can be kept more sanitary and healthful—that a brick house gives him more standing in his community and better credit at the bank.

"It is undoubtedly true that if the facts and statistics were properly marshalled and presented in any community that the erection of frame property would be practically abandoned not from compulsion but from choice."

Thus Mr. Thomas summed up his argument for solid brick.

After exhaustive investigations, insurance experts, Chambers of Commerce, and the United States Geological Survey have come to the conclusion that no other building material ever discovered even approaches solid brick for fireproof qualities. The following expressions of opinion are picked at random from among thousands that are available.

Some years ago, President Snow, of the Home Insurance Co., of New York, issued a pamphlet in which, waiving such considerations as comfort, beauty, convenience, suitableness, strength and adaptability of good construction, he struck home to the *cost* of brick in contrast with the cost of frame.

President Snow asks, "What is true economy in house building? Poor materials are not only inferior but actually in the end more expensive from every point of view.

"By detailed comparative figures which take into consideration the original investment, upkeep, painting, cost of heating, depreciation, and the cost of insurance, it is shown that the use of frame construction is actually in the end more expensive than brick construction.

"From every quarter recitals reach us of men and women, either roasted alive in flimsly built hotels, theatres, stores and factories or crushed to the ground below after jumping from upper windows to escape a worse death—to say nothing of the suffering of horses, cattle and other dumb creatures destroyed by thousands of these fire traps."

One of the most authoritative and re-

cent books on fire insurance "Fire Prevention and Protection," by A. C. Hutson, C. E., says "Brickwork of properly burned brick, properly laid up in strong mortar, with good solid well filled joints constitutes a form of construction which in point of efficiency cannot be excelled as a fire resistive material."

Fire Chiefs and Fire Marshalls of every city and state in the country are urging a standard of safer building. Chief Croker, once famous head of the New York Fire Department, speaking before the Legislative Committee of New York said, "The construction of frame buildings should be absolutely prohibited, as the records show throughout the country that all of our large conflagrations have been caused by frame construction, shingle roofs, etc. Not only New York City, but the United States also, is backward in its building construction. Frame should be eliminated absolutely."

The cost of heating the house is a question which interests every man of moderate means. Referring to the relative cost of heating a frame house versus a brick house, Mr. John D. Small, one of the leading engineers of Chicago, says that *estimating very conservatively a frame house will consume at least* 15 *per cent. more coal than a solid brick house of the same size and will require a larger heating plant.*

That is to say, for every seven tons of coal needed to heat a solid brick house, the same house in frame would need more than eight tons. This added expense continually increases year by year, as the wood shrinks and makes the house more draughty. The man who builds of frame therefore has to waste money in his furnace every winter to pay for the doubtful privilege of owning a frame house. This needless yearly fuel expense must be added to the high cost of painting a frame house every two or three years, to the increased cost of insurance of frame over solid brick, and to the costly and rapid deterioration of frame. The actual yearly cost of a frame house in dollars and cents makes the very slightly increased first cost of solid brick over frame insignificant. "The recollection of quality remains long after the first cost is forgotten." When you build be sure to build an expense-proof solid brick house—a house that will save money every year—that will bring just as much money in the open market five years hence as on the day it was built—frequently more.

A factor which foreshadows the enforced curtailment of the use of lumber for building is its growing scarcity, which is becoming so acute that the Illinois Legislative Investigating Committee sitting in Chicago made an appeal to the President and Congress of the United States for the conservation of the lumber supply.

Quite apart from considerations as to which material gives the best service to the owner, contractors find it to their own interest to use solid brick in preference to any other material.

The contractor is interested primarily in getting the building up and off his hands as quickly as possible, consistent with the time required to make a good job. Common brick is the one material which can almost always be obtained locally without delay and rail transportation expense. Lumber and many other materials have to be brought long distances.

Because of the small size of the units, brick is an extremely flexible material to use. Every brick is the same size and there is no waiting for special sizes for special locations, as with almost any other building material.

Brick can also be stored if necessary in any kind of weather without deterioration. Brick does not check, warp or split and does not spoil when wet.

The best insulation aganist heat, cold and dampness is provided by the wall of solid brick. Everyone knows how cool the inside of a solid brick building is on a hot day. It protects the inside of the house by its mass. In winter it keeps out cold just as efficiently as it keeps out heat in summer.

The solid brick wall is always dry. It it proof against dampness coming from outside, and condensation from within.

If an addition is to be made, a new wall can easily be joined to an old one at any point.

New openings can easily and quickly be made, and every brick taken out can be used over again, no matter how long the wall has been standing. And the enormous strength of the solid wall makes the safe cutting of even wide openings perfectly feasible under most conditions. Cutting new openings throws more load on the parts of the wall that are left. The solid wall has great reserve strength to carry these extra loads.

Because of the small size of the brick units, openings can be cut to the exact dimensions desired.

In many places, such as garages and factories, the interior walls have to resist impact and blows which might easily, and frequently do, break to pieces weaker walls of thin material. Solid brick stands up and takes heavy punishment without material damage, because the blows are resisted by the inertia of a compact bonded mass, rather than the breaking strength of a thin brittle substance.

Again, someone may want to drive a nail in the wall. If the material employed for backing and interior masonry is thin and brittle and a nail is driven at random through the plaster, one whole large section may be shattered, ruining the wall and the plaster. Common brick, being a solid mass, cannot be damaged this way.

Solid brick makes a very strong wall to which to fasten wood guards, shafting, plumbing work, wall radiators, etc. It can be plugged without damage and develops great resistance to direct pull, owing to the fact that brick is laid in small units; making a solid, thoroughly bonded construction.

One of the most important functions of a wall is to support the floors and the roof. A solid brick wall forms a splendid solid bearing surface. Being built of small bonded units, the load is quickly transmitted over a large area of the wall.

In case of fire, partitions or backing containing large air spaces generally crack and splinter on the side next to the fire and become a total loss. Brick, being solid, successfully resists the action of fire and a solid brick wall does not have to be rebuilt when the building is restored unless it has been thrown down or damaged by mechanical forces, such as falling beams, etc. That is why fire insurance companies class inferior masonry construction as little better than lumber.

Be sure, therefore, that all the bearing members in your building rest upon solid, really fire-proof brick. Run the solid brick right up to the roof.

Don't put wood posts in the basement. Basement floors are generally damp and in time the bottom of the posts will rot away. Wood posts are not fire-proof. Brick is not affected by dampness, never shrinks, and never rots.

Records show that many fires start in the basement; therefore make every partition in the basement a solid fire-proof brick partition. An all-brick basement helps sell the house.

In some localities, where common brick is of a very hard quality, it may be used for the basement floor. Such a pavement adds greatly to the appearance of any basement. We do not, however, unreservedly recommend common brick for paving. In some localities the clay does not make common brick suitable for this purpose. Ask the brick manufacturer in your district whether his brick will give

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Philadelphia.

good service when used for basement paving.

Vines

Beautiful effects may be produced by training vines on the walls of a brick house, effects, by the way, denied to the owner of a frame house. Vines on a wood house cause it to decay very quickly, and must be torn down frequently for painting.

Many are the decoration possibilities of common brick when used for garden walks. These bricks are laid flat on a bed of sand, with sand joints, and a brick border. Many people like to have grass and moss grow up in the joints between the brick. If this is not desired sprinkle some salt occasionally over the walk.

We make the same reservation on the suitability of brick for garden walks as for basement paving.

The kitchen wall always has a great deal of hard wear, and should have a surface that cannot be disfigured. The walls of kitchens in houses of the better classes are sometimes laid with common brick exposed up to the height of the doors. A projecting course of brick, or a small wood mould, is run around at this height, the wall above being plastered.

This treatment is a little more expensive than a plastered wall, but looks much neater. It has a surface that stains, grease, or smoke will not disfigure.

If this treatment of the kitchen is adopted, and the exterior walls of the house are 8 inch brick, it is advisable to lay the exposed brick in the kitchen as a 4 inch veneer with about 1 inch air space between the back of the veneer and the 8 inch wall. If the other walls of the kitchen are 8 inch brick bearing partitions, lay the exposed face toward the kitchen in selected brick. If they are not bearing partitions, build them of 4 inch brick.

This treatment involves the construction of a small room in the basement with brick partitions the same size as the kitchen above. This room can be used as a cool storage room for vetegables, or for many other purposes. Even if the kitchen walls be plastered always allow the brick behind the range to "show."

If you build a house to sell, be prepared to tell your purchaser that you have a brick—a *solid* brick house. Tell him that every joist and every roof timber rests upon solid fire-proof masonry—*really solid* and not hollow and brittle. Take him down to the basement, and after telling him that insurance statistics show that one-third of the number of fires start in basements, point out that here is a brick basement without a wood post in it, with every partition built of solid brick. Tell him too, that every winter he will save 15 per cent. of the coal bills he would have to pay in a frame house; that he will save from one-half to two-thirds of his fire insurance premiums; that his house will be warmer in winter and cooler in summer; that he will never have the heavy expense of painting the outside walls; that there are no hollow spaces in the walls to harbor vermin. Tell him that here is a house that he will always be proud to show his friends, that will give him more standing in the commnuity and more credit at the bank. Besides, a house where his wife and family can sleep with little fear of being burned in their beds.

Tell him, too, that though he is buying a house for a home, circumstances may arise that will force him to sell. A well-built solid brick house does not deteriorate during the first five years after it is built, and is good for twice or three times the life of a frame house. A man selling a brick house therefore can recover practically all the money he put into his house, and if the land has increased in value, this increase will represent almost clear profit to him. A man who sells a frame house has to stand a considerable loss in the reduced value of the house itself. This loss in value will reduce and may entirely offset any increase in the value of the land. Buying a solid brick house is better than putting money in the bank for it can be used while it is increasing in value.

If your house is built of solid brick, it will stand far out above the ordinary frame house as a desirable investment, and the profit in dollars and cents on the sale will show a much higher percentage on the cost of building than if you put up a frame or an inferior masonry house.

The loaning value of a solid brick house is also much greater than that of a frame building, owing to the slower depreciation.

The owner of a solid brick house can get a much larger loan on it than he can on a frame building costing the same amount, which shows the opinion of bankers on the matter of depreciation.

Solid Brick, the Standard Construction

Architects and engineers never question a solid brick wall. It has been standard construction since the days of the Pharaohs and is today the most economical and satisfactory material known to the builder—*Brick.*

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

Heat the Whole House Cut Fuel Bills

There are no cold rooms in the home heated by the Pawnee Pipeless Furnace. This simple, efficient system maintaims an even temperature of 70 degrees throughout the entire house even in zero weather at a fuel saving of from 25 to 40 per cent. No pipes, no repairs. No coal gas or dust. Low initial cost. Easily installed in about a day without tearing up walls. Burns hard or soft coal, coke or wood. Write for illustrative booklet.

As The Editor Sees It

THE construction industry is greatly interested in the recent great drop in lumber prices. This factor will play a large part in any reduction in building prices. Some authorities, however, have ventured the opinion that the drop, at best, is only temporary, and that, as soon as building activity increases in the spring, and there is congestion in transportation, lumber prices will rebound.

However, lumbermen are apparently quite equal to solving the transportation question satisfactorily, and we read in the "New York Lumber Trade Journal" that:

A recent circular or trade letter of the West Coast Lumbermen's Association, headquarters, Seattle, has a large bearing upon the matter of water shipments at the present time. And as a corollary thereto, issued at about the same time, was a trade circular of the Pacific Coast Shippers' Association. The first named said:

Aside from the tendency of mills to close on account of restricted markets, the outstanding trade feature of Pacific Northwest lumber is the increase in shipments by water to Atlantic Coast ports. Since the increase in transcontinental rail freight rates, Oregon and Washington mills have shipped 45,434,268 feet of lumber through the Panama Canal to Baltimore, Philadelphia, New York and Boston. In three months, since the increased freight rates became effective, this water movement has approximately equaled the Pacific-Atlantic Coast lumber shipments for the entire year of 1919. While the water movement is relatively unimportant compared with the immense production of Oregon and Washington mills, it is significant in connection with the present lack of lumber-handling facilities on the Atlantic Coast; and the potential movement of lumber by water to Eastern markets when Atlantic Coast lumber storage and distributing facilities are increased, as now contemplated.

All of which is as interesting as it is authoritative. And the allusion to a present lack of adequate facilities for lumber handling by water at Atlantic Coast points; and the potential and prospective increase thereof in due time at an early date and particularly of interest recently.

It would appear fairly obvious perhaps that this increase immediately and at least partly grows out of the recent advance of railroad rates to the eastward and thus it brings up the whole matter of routes and rates, and though the activities by the waterway are at this time probably somewhat dependent on the advance, the movement thus was ultimately no doubt inevitable as facilitating in due course movements in bulk or large volume to the Eastern seaboard. The means by which it presently brought to a greater momentum are merely factitious and therefore the activity for many reasons, as indicated, promises to be not impermanent. Indeed, steps by many in interest and in various ways are being taken now to the end of permanency.

All of which by no means implies that the rail routes are able to fall into destitude. On the contrary (and this matter will be adverted to farther along) steps are even now being taken to iron out in as full and practicable measure as possible, and as speedily, the complications of lumber shipments due to the rail advance and with every prospect of some success under the impetus and pressure of necessity; only the matter in the value of things, will take some months' time at the least, in all probability.

The whole, and especially the rapid coming to the fore of water shipments, to the Atlantic Coast, merely illustrates the rapidity with which Pacific Coast Products long known on this side of the continent, are increasing in use by leaps and bounds and for obvious reasons. The greater use of the water routes in such an event appears logical and obvious.

As a matter of fact the genesis of this movement was not only not unlooked for but expected by some experts in the line of Pacific Coast production and actual steps taken in preparation to take care of it. This is instanced in the case of a man directly

BLUE PRINTS

interested who for the purposes of looking out the best locations for the receipt of water shipments at the port of New York, for example, made airplane trips over the Metropolitan District, by which means he got a good close-up and general layout of the topography which he could thus work from in detail. It doubtless gave him details, in fact, which could be afforded as well by no other process, and in the briefest possible space of time; and while such an aerial survey would not give any definite sort of idea as to depth of water and correlated matters in all cases, such could be worked out later. The main point is that the water movement was anticipated, although no immediate activities were put into effect previous thereto in response to any preconceived ideas on the point, so far as we know, but purely and naturally evolutionary. In other words, the accession of water shipments was a natural unforced growth, without any special planning just at the time to bring it about, although anticipated and steps taken to take care of it, and further steps also are being taken to handle it in a scientific manner, thus constituting an interesting and wholesome new development in lumbering annals. It will all certainly tend to make in a scientific way for success in the long run in the distribution by water to the Atlantic Coast ports of Pacific Coast products.

At the same time the Pacific Coast Shippers' Association advised that the subject of water transportation was not only receiving the attention of the lumbermen in all the Pacific Coast cities, but that it would be only a question of a short time until the steamship lines were in position to offer a workable rate to the East Coast on Fir lumber, with details given in full to that end. While someone might call this propaganda, it certainly is propaganda of a very definite sort when at the same time still further details were outlined and the statement definitely made that he operation of a fleet of barges would start "in the neighborhood of January 1," with the added indication that their intentions and plans compassed the maintenance of an Eastern office for "the rebilling of these consignments upon arrivals at New York and other ports at destination," which was characterized as one of the features of water transportation that had caused considerable difficulty and questions as to feasibility of plan. They will, they state, be in position to furnish backhand rates from Atlantic Seaboard ports within a short time and it is the announced intention "to incorporate such information in the Lumbermen's Freight Rate Guide when re-issuing the Eastern States."

Another angle of the matter was the receipt by the Chamber of Commerce of Seattle, widely quoted in Coast papers, of recent date (one of them displaying it conspicuously in a box on its front page), of a request by the White Pine Association of Tonawanda for information on steamship companies "which might be interested in handling cargo lumber and shingles from Pacific Coast points via the Panama Canal to New York harbor and thence inland by barge up the Erie Canal to North Tonawanda."

"This business," says the communication from Henry Adamy, secretary, "started just before the war but was soon halted."

Comment from Buffalo parties on the Coast at the time might seem to indicate that this might be some special phase of the matter, although not positive at that time and distance away, but pointing out the fact that the Tonawanda and Buffalo wholesalers in the large would have no incentive to ship around by Canal and through the Erie Canal when those very stocks would in due course and by far the larger part have to go forward again to customers East of Buffalo and Tonawanda with their uneconomical and entirely unnecessary double haul there and back between the seaboard and the foot of water navigation. It all only goes to show, however, how widespread interest there is in the matter.

Meantime, the discussion of the water route as above would not be complete without the statement that things are already doing in process or straightening the tangle caused by the eastward and transcontinental advances in rail rates. This may and probably will, according to indications, take still some months for a successful settlement. At the same time there are few if any who do not hope and look for some sort of a fairly successful solution all around and many compelling reasons could be cited to that end.

On the other hand, again, some sort of a happy solution for the lumbermen (and ultimately the lumber buying public, be it remembered, for they pay in the end the freight bill) may possibly be arrived at earlier than a lot of us really can expect. Quoting against the Pacific Coast Shippers' Association, they recently said:

"We have received rumors and partial authentic advices from Chicago that the carriers are now considering a 95c. rate on lumber to New York, Boston, and other Atlantic Coast points, 90c. to Buffalo and a graduated lower rate to points between Buffalo and Chicago. It is contemplated to make this

Smith-Hardican Co., 1606 Cherry street; Potts Bros. & Cooperson, 129 North Eleventh street, and F. A. Havens Co., 845 North Nineteenth street, are figuring.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

Refinery (add.), Delaware avenue, south of Shackamaxon street, $300,000. Architect, private plans. Owners, Pennsylvania Sugar Co., on premises. Brick and steel, 9 stories, 55x88 feet, slag roof, concrete floors, steel sash, elevators, waterproofing and dampproofing. Contract awarded to O'Meara Const. Co., 253 South Quince street, Philadelphia.

Storage Building (add.), 1909 McKean street, Philadelphia, $7,000. Architect, private plans. Owner, Mary E. Uhler, 1841 South Broad street, Philadelphia. Brick, second story addition, 76x17 feet, slag roof. Contract awarded to Wm. G. Uhler Sons, 1841 South Broad street, Philadelphia.

Building (alts.), 315-17 South Fifteenth street, Philadelphia. Architects and owners, Stewardson & Page, 316 Walnut street, Philadelphia. Carpentry, millwork, plastering, changing present buildings into offices. Contract awarded to Frank E. Wallace, 1220 Chancellor street.

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

SHEETROCK

The Fireproof Wallboard

It Can't Warp

Every builder should insist upon using Sheetrock because Sheetrock, made from rock, positively cannot warp, shrink or buckle. Atmospheric changes have no more effect upon Sheetrock walls and ceilings than upon the permanent rock from which Sheetrock is made.

With all its durable qualities, Sheetrock can be put up with the same ease and speed as the ordinary wall board. The broad ceiling-high sheets can be sawed like lumber and as easily and securely nailed to the studding or joist. Sheetrock patented nailing edges afford great nailing strength and make possible tight, flush joints. The joints, when treated with Sheetrock Finisher, are effectively concealed when the wallpaper, paint or calcimine is applied.

Sheetrock jobs, in short, combine all the strong, lasting fireproof qualities of the standard wall and ceiling with the economy of the usual wallboard.

We are ready to give your order for Sheetrock our prompt attention.

Sheetrock is ⅜ in thick; 4 ft. wide; and 4, 5, 6, 7, 8, 9 and 10 ft. long
A Complete Line of Moulding and Studding to be used with Sheetrock

rate effective about March 1, 1921, in case the carriers are successful in securing the authority of all the lines interested and also of the Interstate Commerce Commission, who must approve all reduction in rates. The carriers' tonnage on eastbound shipments has fallen to such an extent that they are actively engaged in soliciting the haul on all classes of freight."

The statement is as definitely concrete as it is interesting. The railroads may be somewhat in the attitude of the man who prefers half a loaf to no bread; in other words, they would rather take reasonable less for the lumber haul than to kill the freight (and make it take to water, as far as possible), and thus to get no haul at all, or a vastly reduced volume of business. It must be added, however, that the railroads perhaps are likely in effect to attempt for reasons to put the burden of proof on the shippers to show that the present slump in lumber shipments is due to the advanced rate and not to a concurrent slump in the lumber business itself, which is not the same. Be that as it may, the roads appear wrong when they try to put it over by making a comparison in terms, say, of wheat orapple shipments. The conditions are by no means the same except only as indicated in the mere mutations of names of products shipped and it would seem that every phase of lumber freights and shipments should be determined on its own inherent attributes and not in comparison to some other commodity to which same or similar attibutes may or may not be concomitant, depending entirely upon chance or circumstance, as the case may be.

This paper is dealing with and discussing facts and starts out with no idea merely of proving any preconceived thesis, for it has none. But it remains that while water shipments are no doubt destined to grow by leaps and bounds, at the same time the West Coast Lumbermen's Association advices are, sifinicantly, that "in three months, *since the increased freight rates became effective* (and we use italics to call special attention), this water movement has approximately equaled the Pacific-Atlantim Coast lumber shipments for the entire year of 1919." So it can be and has been called in question if a considerable portion of this might not have gone by rail if the rates had not been increased, and it can be offered in rebuttal that the possible contention that the failure of the railroads to get a haul not because of the high rate, but because of a lack of business thus certainly tends to fall down to the ground. Because there is business moving, as the growing water shipments show, regardless of whether normally it might or would have gone partly by rail if the rates had not been advanced. And the string of idle cars, therefore, all along the Columbia River signify little or nothing as far as lumber activities are concerned. So on the face of it, some one might conclude that the rail routes are in to lose some of the business anyway, and that the movement is apt to be swifter if the spread or disparity between rail and water rates is large enough greatly to handicap Pacific wood goods by rail in competition with others.

The whole certainly constitutes one of the large lumber questions of the hour.

TEXT OF SENATE COMMITTEE'S PRELIMINARY REPORT

Housing Shortage Is Serious Even in Smaller Cities — Interstate Commerce Commission's Orders Have Encouraged Profiteering—Coal Profiteering, Unchecked by Department of Justice, Is a National Disgrace—Labor and Trade Schools—Finance and Taxation—Encouraging Home Ownership—As to Public Health and Morals.

The committee authorized by Senate Resolution No. 350, of April 17, 1920, was directed to inquire into the general building situation and to report to the Senate on or before December 1, 1920, such measure as may be deemed necessary to stimulate and foster the development of construction work in all its forms.

The committee has thus far devoted its attention to housing rather than industrial construction. Information as to conditions existing throughout the country has been obtained through correspondence, questionnaires, and field investigations. Information as to conditions existing throughout England and France has been obtained through field investigations by experts. The committee has held hearings in the principal cities of the United States, excepting the far West.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.

A Housing Shortage

There is no doubt that there exists a serious shortage of housing, not only in the great cities, but in the smaller cities as well, even in the far West and South, and that this shortage has a material effect upon industrial growth and upon public health and morals. The total housing construction during the last four years is hardly equal to that of a normal year. Rentals have increased from 25 to 150 per cent. Four years ago a house for a workingman cost on an average about $3,000. Today the same house costs $6,000. Houses produced at such cost are beyond the purchasing power of the workingmen of this country. To buy such a house or to rent it, a workingman would have to pay the equivalent of a rent of at least $60 a month instead of the $30 a month that he is accustomed to paying. Industrial development, together with increasing immigration, will add to the present urban congestion.

Interference by Federal Government

The building industry was disrupted during the war by Federal intervention, and has been unable to get back on its feet since the armistice because of transportation, fuel, and labor difficulties, because of the diversion of credit to commercial purposes, and because of handicaps of taxation. The industry would naturally have revived, because of the great need of construction, if it had enjoyed pre-war transportation conditions (both as to promptness of delivery and low cost), par-war fuel conditions, pre-war labor efficiency, and if investment capital had not been diverted to other channels, especially through tax-exempt securities, and had not been driven from the building industry by high income and excess profits taxes. It now seems beyond the power of private individuals, municipalities, or States to overcome the present handicaps of transportation, fuel, finance, and taxation.

Provide Facilities Rather Than Subsidies

The actions of various States in regulatory rent laws, or toward subsidy or toward participation in the housing business, promises no permanent relief. The unfortunate results of the attempts of the English Government along such lines are warnings against similar attempts in this country. The Federal Government must assume the responsibility for its war-time acts in curtailing industry as well as for its peace-time acts in diverting transportation and capital from the industry. While helpful Federal action is justified, such Federal action should be to provide facilities rather than to provide subsidies.

Costs Should Be Reduced

The committee well recognizes that building—including homes — depends upon the cost of transportation, fuel, and labor, and that by no possible artifice can buildings be produced at less than the cost of these basic elements; but the committee believes that there is yet much to be accomplished in the way of greater efficiency of labor; in the way of elimination of profiteering in coal; and in the way of transportation, through more equitable rates and through more regular deliveries.

Transportation

The freight rates on building materials were increased some 50 per cent. in June, 1918, and some 40 per cent. in August, 1920, making a total cost of freight on building materials of nearly $2.10, as compared with $1 before the war; the total for other industries being about $1.75, compared with $1 before the war. Shortly after the ap-

pointment of this committee the transportation facilities of the country were allocated to coal movement through priority orders of the Interstate Commerce Commission, and the subsequent irregularities of delivery of building materials have been instrumental in bringing about the recent stagnation in the building industry. The committee believes that the issuance of exparte orders by the Interstate Commerce Commission has occurred without a full appraisal of their consequences by the Commission and that such orders hae made opportunities for profiteering and have been injurious to general industry. It is the function of the Interstate Commerce Commission to regulate railroads and not to regulate industries. The committee would direct the attention of the Senate Committee on Interstate Commerce to this matter, wih a view to amendment of the transportation act in order to check the issuance of exparte orders. Intelligent supervision of transportation matters should insure the co-ordination and full use of railways, waterways, coastwise shipping, and terminals, so vitally necessary at the present time.

Urges Reports on Fuel Production and Distribution

National development depends upon an ever-increasing supply of power. Heat is as necessary for production, in fact, for human existence, as is air or water; its use must be continued from day to day and can not be deferred or interrupted.

The nation is dependent upon coal as its chief source of heat and power, yet the production and distribution of coal is badly organized and subject to manipulation at the expense of the people.

Coal profiteering, especially as it has followed the priority orders issued by the Interstate Commerce Commission, has continued unchecked by the Department of Justice, and is a national disgrace. Coal speculation has been permitted to monopolize the transportation facilities of the country, retarding necessary construction, and increasing the basic cost of manufacture and distribution of commodities in general. It has bled the home owners, public utilities, and the industries.

The imperative necessity of continuity of supply of fuel demands the fulfillment of contractual relations in this industry more than in any other, and yet one of the primary causes for the disgraceful and disastrous conditions during the past six months has been the repudiation of contracts. An exceptional demand not only brings about reckless and unwarranted repudiation of contracts made for delivery of coal, but the substitution of inferior quality at higher prices. Indeed, coal contracts are so drawn as to be breakable in delivery, in quality, and in price.

Our investigation into the coal situation has convinced us that the private interests now in control of the production and distribution of coal, in spite of efforts by some, are actually unable to prevent a continuance or a repetition of the present deplorable situation, and that it is the duty of the Government to take reasonable and practical steps as it may to remedy the evil.

An inherent responsibility of the Government is the protection of its people. To assure the mining, transportation, and distribution of coal at fair prices is a public duty from which the Government can not escape. But your committee believes that governmental administration of the production and distribution of coal should be a last resort, as governmental activities should always be directed toward encouragement of private initiative and enterprise.

While the fulfillment of contractual relations is of first importance to the stabilization of the industry in the interest of the consumer, the producer, and labor as well, your committee believes that the Government should at all times be informed as to coal distribution and at this time recommends:

That all coal operators, wholesalers, jobbers, and retails be compelled by statute to file at regular and frequent periods with some Federal agency reports on the total tonnage produced or handled, the size and quality thereof, the amount of tonnage contracted for, the amount sold on contract and at spot sale, to whom, together with the prices made or received under such contracts or sales, and producers and distributors to make regular reports sufficient to determine their costs and profits, and the corporate interrelations or the communities of interest, if any, between companies producing and distributing coal.

With this and collateral information in the hands of Federal authorities for possible use by the Department of Justice and other Government agencies, prevailing evils as to irregularity in deliveries, inferiority of quality, profiteering in prices, and undue monopoly of transportation facilities should to a great extent be eliminated. But if no other remedy can be devised, it may be necessary to enact some form of Federal licensing to meet the situation.

Fuel thrift by the small user and fuel thrift by the large user through storage, scientific combustion, and transmission should be strongly encouraged by the Federal Government.

Labor

The misdirection and exploitation of some groups of organized labor, through grafting leadership, has been revealed in New York City and is reported in some of the other large cities. This has spread to combinations of employers, who, working together with such grafting labor leaders, have combined to force nduly high prices. These conditions are called to the attention of the Department of Justice and that department is urged to prosecute the wrongdoers whenever they are found to have violated the Federal statutes.

The efficiency of labor was decreased during the war through the allocation of young and specially trained men to the war, as well as through the cost-plus system of contracts on Government work. The cost-plus contract has been continued since the close of the war because of the uncertainties of delivery and because of the fluctuating spot prices of building materials, due to interrupted transportation. The committee recommends abandonment of cost-plus contracts by the Government, States, municipalities, and by private individuals in order that competition may be encouraged and labor efficiency stimulated.

It is most desirable that the cities and States should take immediate action to promote the establishment of trade schools for the training of apprentices for the building trades. Unless the present drift away from the building trades is reversed the country will find itself short not only of trained journeymen, but also short of competent foremen and, finally, short of practical employers as well.

The American Federation of Labor has formally declared itself in approval of home ownership rather than tenantry, and the committee has received the earnest assurance of co-operation in making good the housing shortage from the national and local leaders of the building trades sections of the Federation.

Private Initiative Should Be Encouraged

The building codes of the country have not been developed upon scientific data, but rather on compromises; they are not uniform in principle, and in many instances involve an additional cost of construction without assuring more useful or more durable buildings. The committee recommends the crea-

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

tion of a Federal bureau which shall serve as a clearing house of the best knowledge and practices in construction work, to bring about greater uniformity in building codes, conservation in the use of lumber and other building materials; standardization of such parts of construction as may be standardized without interference with design; publication of fluctuations in wholesale prices and publication of available quantities of supplies of building materials; publication of methods of city planning as well as the sound methods of financing; all to the end that the best knowledge of the country may be collected and disseminated, so that private initiative may be encouraged and directed toward well-located, serviceable structures of good design, and at minimum cost.

Finance—Taxation

There has been an unprecedented demand for capital for trading purposes; much capital which has been used for non-essentials, for hoarding, and for profiteering has been able to yield interest rates and underwriting charges which the building industry has been unable to offer. The flow of investment capital away from the construction industry has been accelerated by the increase in tax-exempt securities, now amounting to some $14,000,000,000—nearly two and a half times the prewar total. The steady flow of investment capital away from the construction industry has also been accelerated by the efforts of the Federal Reserve Board to maintain as great a quantity of funds as possible in liquid condition. Long-term deposits, including savings accounts in national banks and trust companies, which have increased to some $2,000,000,000, have been chiefly used in promoting trade in consumables rather than for capital investment.

The committee recommends modification of the Federal Reserve Act so as to permit the Federal Reserve Board to direct that a portion of the long-term deposits in the member banks—at least a portion of the deposits in the savings departments—be invested in long-term securities and mortgages, in order to give greater security to the savings and to assist in providing homes for the thrifty.

The committee recommends revision of the taxation system, in order that investment in homes and in general construction may be encouraged. If such revision does not restrict the issuance of tax-exempt securities, reduce surtaxes and excess profits taxes, it should grant for a limited period tax exemption to real estate mortgages and perhaps to the profits from home building, provided such profits so exempted are reinvested in the construction of other homes.

Taxation on earnings invested in capital commodity should be lower than taxation on earnings which are spent. For the purposes of taxation, profits upon the sale of capital assets should be prorated for assessment during the years of their accrual. For the convenience of the general public, the administration of the Federal income tax system should be decentralized.

Home Ownership

The committee realizes the importance of encouraging home ownership, particularly on the part of those who are rearing families. It realizes the injustices now suffered at the hands of the so-called loan sharks, and it indorses the principle of the Home Loan Bank bill, which is designed to facilitate a wider distribution of real estate mortgages through standard bond issues based upon such mortgages and exempted from surtaxes. The committee would, however, recommend that this bill be broadened, so that institutions, other than the building and loan associations, who may desire to rediscount their home mortgages under Federal supervision, shall be enabled to participate. The relief which such a system of long-term banking promises to the commercial banks of the country on the one hand and to the home owner on the other, together with the prime security which such bonds would afford to the conservative investor, combine to make the establishment of such a banking system a most desirable national facility and a most promising substitute for governmental participation in the housing business.

Thrift

To the end that popular saving and thrift may be encouraged, the committee recommends that all Federal thrift activities be consolidated under the postal savings branch of the Post Office Department, and that the present postal savings law be amended to provide adequate interest to the depositors, payable quarterly, as well as sufficient compensation to the postmasters to call forth their energetic efforts in developing this important national facility.

Co-operation

The committee believes that unless the Federal Government continues to stimulate co-operation of those engaged in labor, transportation, finance, and fuel production with those engaged in general construction that the growing scarcity of homes may eventually force upon the Government an undesirable participation in the housing business, and it therefore seeks authority to continue its investigations and to formulate data which it gathers in support of the recommendations which it may make.

Exhibit

The American Health Association, which is composed of the commissioners of the Boards of Health of the largest cities in the United States, convened in Detroit, Mich., on November 30 at the request of this committee and submitted the following statement based upon surveys recently made in each city:

December 4, 1920.

Hon. William M. Calder,
Senate Committee on Reconstruction,
29 West Thirty-ninth Street, New York City.

My Dear Senator Calder: At the request of the Senate Committee on Reconstruction, I called together the health commissioners of this country from cities having a population of 200,000 or more. We met in Detroit on November 30 and remained in session for two days.

Reports were received from a considerable number of the cities of this size, and the representatives discussed the housing situation very seriously. It was rather remarkable that there was unanimity of sentiment regarding the problem. The fruit of our labors is shown by a formal statement which was unanimously passed by the conference.

I was directed to transmit our conclusions to your committee and to state that the health commissioners stand ready to support the Senate committee in their campaign for conditions which will make it possible to build houses in the cities of the United States. I can not speak too strongly of our conviction that the present housing situation is a real menace to the public health of this country.

Here is the formal statement:

"The housing survey undertaken by the health authorities of American cities of 200,000 persons or more has been completed. Several cities have submitted their information, and these reports ho in common certain outstanding features

"1. In every city there is abnorma overcrowding. From 20 to 30 per cen of the population of the cities studied thus affected.

"2. These surveys show an ave diminution of 80 per cent. in the nc

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

volume of new buildings for residental purposes. This condition has continued for three years.

"3. As a result of the abnormal overcrowding, thousands of families are forced into insanitary and dangerous quarters. Health authorities are powerless because it is impossible to vacate such premises under present conditions. This usual legal remedy is useless to cope with the situation. It can not be used because there are no other and better places to which such families can move.

"4. Overcrowding means close contact, and has resulted in a marked increase in the infant death rate. The relation of bad housing to child health is startling. Infant morality is 50 per cent. higher in districts where there is the greatest overcrowding.

"5. Overcrowding has propagated and spread tuberculosis. This disease is at least twice as prevalent in overcrowded quarters as in areas of normal housing. Our records show that 80 per cent. of the tuberculosis patients are obliged to live at home. Overcrowding makes it impossible to segregate the patient and thus to protect other members of the family.

"6. All communicable diseases, especially those affecting the respiratory tract, are rapidly spread by overcrowding. Influenza and pneumonia are conspicuous examples of this evil. It is needless to mention the difficulty of controlling communicable diseases in the face of overcrowding, because of the impossibility of maintaining quarantine or isolation.

"7. Overcrowding bears an important relationship to the social diseases. This is evidenced by the undue prevalence of venereal diseases in communities where this situation is most acute. Lodgers are intermingled with the family, with all the obvious evils of such social arrangement.

"8. Living under the strain of unusual and insanitary conditions increases mental and moral degeneracy. The lack of privacy is conducive to physical and moral suffering, and the lack of comfort so necessary to long life and happiness.

"9. It is the sense of this gathering that the ideal housing conditions to meet health, comfort, good morals, and good citizenship demand that every American family occupy a single dwelling. In communities where this is not feasible, single separate quarters or apartments, well lighted and well ventilated, must be placed within the reach of the poorest of our citizens.

"10. This survey shows not only overcrowding and very limited building operations, but also a conspicuous absence of co-ordination of effort in reaching a solution. Efforts should be made to acquaint the public with the urgency of the housing danger. We must earnestly petition the Senate committee to take cognizance of, and to give publicity to the lamentable situation which is undermining the public health, the public morals, and the social stability of the Nation.

"11. It is imperative that your committee shall give attention to the influx of immigrants. Thousands of new arrivals have been brought into communities totally unable at the present time to decently house their present population. Europe is overrun with infectious diseases. Typhus fever, bubonic plague, cholera, smallpox, and various intestinal disorders threaten America. Immigration bears an important relationship to the entrance into our country of these diseases, and with the present housing conditions, the danger is vastly greater.

"12. The entire housing problem is so urgent and its danger so imminent that decisive and immediate action is imperative. We beg of you to lose no time in finding a remedy for the conditions that threaten the lives of our people and the stability of our Government."

Respectfully,
ROYAL S. COPELAND, M. D.,
Commissioner.

* * *

MARYLAND FRAME CHURCH 238 YEARS OLD

The durability of wood as a building material is strikingly emphasized in the old Quaker meeting house at Easton, Maryland, built in 1682-4 and probably the oldest frame building in the country without additions or alterations from the original structure. Its frame, inside woodwork and some of the weatherboarding is the same as when built in the days when William Penn, who visited the building, was laying out the city of Philadelphia. The structure is sixty feet by forty-four and is made from white oak, white pine and cypress from the Maryland forests.

The church is still a place of worship and has been visited and attended by many notable persons.

Repitition tends to create **habit**, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

**Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Philadelphia.**
